

Philipp Hilbert. *Technical Product Manager, AI Investing.*

Positioning, fintech-native product manager with 13 years owning regulated products end-to-end, from payments and insurance to defence AI, who knows when to let a model decide and when to keep the ledger deterministic.

Dear Bjak team,

Bjak's investing superapp is technically harder than most fintech products, and the job description names the reasons honestly: real money, external financial rails, regulatory requirements that vary by country, and the discipline to know when AI improves an outcome versus when it introduces unacceptable uncertainty. That is the class of product problem I have spent the last decade working on, and it is the reason this role caught my attention.

My background spans regulated, high-consequence product domains: a P2P payments startup I co-founded at Kvitt Payment Solutions was acquired by Sparkasse and operated inside the girocard ecosystem. I shipped an insurance B2B SaaS platform at EMIL Group from concept to production, restructured the delivery organisation to stop attrition, and cut the time to launch a new insurance product from months to under a week. At Rohde & Schwarz I owned an AI and data platform for a multinational defence programme, where the correctness bar is absolute and the audit trail is not optional. Across these roles the through-line is the same: own the vertical end-to-end, make the trade-offs legible, and keep money or data in a known state.

On the AI side: I use AI tooling daily in my own work, Claude Code, Cursor, GitHub Copilot, Lovable, and agentic workflows in n8n, and I have built evaluation loops and human-in-the-loop checkpoints into production systems. I take the same position Bjak does: AI is a means. For an investing product, the settlement ledger and the transaction state machine stay deterministic; AI earns its place in the user-facing layer and the analytics layer, with explicit evaluation criteria and fallback paths. I have written those specs and defended them to engineers and to compliance teams.

Southeast Asia's regulatory environment is fragmented by design, which means shipping across payments, insurance, and wealth requires a PM who can hold the regulatory requirements inside the product spec, not alongside it. I built that skill at the Federal Employment Agency handling national-scale data under German public-sector governance, and at CLINET Platforms integrating into hospital information systems under clinical-workflow constraints. The pattern transfers.

I am remote-capable, comfortable in distributed international teams, and available at short notice. I would be glad to work through a practical task or technical interview quickly, the one-week process you describe suits me well.

Best regards, *Philipp Hilbert*
