

Philipp Hilbert. *Technical Product Manager, AI Investing Superapp.*

Positioning, fintech PM with 13 years in regulated products, payments, insurance, and AI platforms, who knows where deterministic systems must stay in control.

Dear KIRA Hiring Team,

I am applying for the Technical Product Manager role on the AI Investing App. My background sits at the intersection of regulated financial products, technical platform ownership, and AI-native delivery, which maps closely to what KIRA is building.

My most directly relevant experience comes from two sides of the fintech stack. At Kvitt Payment Solutions, I built a mobile group P2P payment product from zero and took it to acquisition by Sparkasse inside the girocard ecosystem. That meant owning payment state correctness as the absolute product constraint, not a nice-to-have, the thing that could never be wrong. More recently, at Rohde & Schwarz, I owned an internal AI and data platform end-to-end: I drove a GitOps rollout that reduced deployment time from days to thirty minutes, and I redirected the entire product strategy based on instrumented workflow analysis when a well-funded UI-led approach recorded exactly zero real clicks. Both experiences taught me the same lesson KIRA's posting articulates clearly: AI is a means, not the goal, and the bar is knowing precisely where deterministic systems must remain in control.

On the regulated dimension, I have worked across insurance (EMIL Group's B2B SaaS platform for insurers and underwriters), health insurance procurement (AOK ITSCare), and defence AI (FCAS programme at Rohde & Schwarz, with data provenance and EU AI Act compliance in scope). Each of these environments required me to build regulatory requirements into the product from the start, KYC flows, audit trails, transaction limits, and privacy constraints, rather than bolt them on at launch. I understand that a fintech or investing platform operating across Southeast Asia carries a layered regulatory surface, and I would approach the KYC, transaction monitoring, and licensing requirements at KIRA the same way.

I am AI-native in practice rather than in title. I use Claude Code, GitHub Copilot, Cursor, n8n, and Lovable daily, for in-repo refactors, agentic workflow design, rapid prototyping, and evaluation loops. I have also developed my own crypto infrastructure tooling, including a backtesting engine and algorithmic trading frameworks, which gives me hands-on fluency with the execution mechanics, perpetuals, DEX routing, slippage, market microstructure, that underpin a wealth and trading product of KIRA's scope. That is not standard PM background, and I think it is relevant here.

KIRA's insistence on moving fast while clearing the gates that actually block launch, regulatory approvals, financial rails, third-party integrations, is the product discipline I find most interesting and most difficult to get right. I have done it in payments, in insurance, and in defence-grade AI. I would like to bring that experience to the KIRA platform.

I am available for an online assessment or practical task immediately and can complete any stage of your process within the one-week window you describe.

Best regards, *Philipp Hilbert*
