Dear Hiring Team at Bjak / KIRA,

I am applying for the Technical Product Manager role on your AI Stockbroking app. My background is thirteen years of owning regulated financial products end-to-end, from a mobile P2P payments startup that was acquired into the German girocard ecosystem, through a B2B SaaS insurance platform, to an AI and data platform for a multinational defence programme, and I am drawn to KIRA because the problem you are solving is structurally the same in every market you operate: reliable financial infrastructure is the prerequisite, and AI is the accelerant, not the other way around.

Your job description names the triad that actually determines whether a fintech product ships: regulatory requirements, third-party financial rails, and the courage to keep deterministic systems in control where correctness is non-negotiable. This is not a theoretical framework for me. At Kvitt Payment Solutions I designed the payment flows and edge-case handling for a group-based P2P product, negotiated the integration with Sparkasse's girocard rails, and took it through to acquisition. At EMIL Group I owned the Claims Center from concept to production for a B2B insurance platform serving insurers, reinsurers, and brokers, a product where a misrouted payment or an incorrect coverage state is not a UX problem, it is a legal one. At Rohde & Schwarz I built the evaluation framework that determined where LLM-assisted analysis was trustworthy and where a human analyst had to stay in the loop.

On the AI side, I build with it daily rather than presenting it as a credential. I use Claude Code and GitHub Copilot for in-repo feature delivery, n8n for agentic workflow orchestration, and Lovable for rapid front-end prototyping. More relevantly for your context: I have shipped AI features with explicit human-in-the-loop gates, defined evaluation loops before launching any model-assisted decision, and designed audit trails that satisfy both internal governance and external regulators. At the Bundesagentur für Arbeit I introduced Dagster and dbt to replace a fragile ETL process, cutting data update time by 75% while making every transformation step auditable, that is the same discipline a fintech AI feature needs.

What I bring to the stockbroking vertical specifically is the ability to sit at the intersection of engineering, compliance, and operations and make legible decisions under constraint. At Bundesagentur für Arbeit I carried a full ETL migration, a UI relaunch, and a bare-metal-to-container migration simultaneously while serving as Deputy IT Security Officer. At CLINET Platforms I cut a five-person team's roadmap to the top 10% of features against agreed acceptance criteria, which raised user acceptance more than fivefold. I know how to make the call about what ships and what does not, and I know how to document that call so it holds up when challenged by a compliance team or a regulator.

I am comfortable working across time zones, have shipped products in multinational distributed teams, and communicate technical trade-offs in plain language to C-level and non-technical stakeholders. I would welcome the chance to go deeper on any part of the KIRA product context in your technical interview.

Best regards, *Philipp Hilbert*
