Dear Hiring Team,

I am writing to apply for the Senior Product Manager role at Jobot. With 13 years of product ownership across B2B SaaS, defence AI, public-sector analytics, insurance, and fintech, I have spent my career doing exactly what this posting describes: taking products from concept to launch, building the business requirements and user stories that engineering can act on, and aligning cross-functional teams around a shared roadmap.

The emphasis on APIs, agentic AI systems, and strong workflows resonates directly with my current practice. At Rohde & Schwarz I owned the internal AI and data platform for the FCAS European programme, leading a cross-functional team of 15+ engineers and data scientists. I introduced GitOps delivery with ArgoCD that reduced rollout time from days to 30 minutes, and I instrumented two competing product workflows to let data, not opinion, decide the direction, which drove a 200% increase in pipeline runs. At the Federal Employment Agency I integrated Dagster and dbt into a national labour-market analytics platform, cutting data update time by roughly 75% and migrating a bare-metal system into a fully containerised environment. Both roles required the same combination this posting calls for: technical depth, stakeholder alignment across business and engineering, and a bias for outcomes over output.

On the AI-native side, I build and operate agentic workflows daily. My solo B2B marketplace construct8 runs LLM agents across the full funnel, matching, outreach, qualification, so a single operator manages day-to-day operations. I prototype in Lovable and Framer, write specs and generate edge cases with Claude Code, and orchestrate multi-step agent loops in n8n. This is not a capability I am building toward; it is how I work now, and it maps directly to the agentic AI requirement in the job description.

I am particularly comfortable with the multi-campaign structure Jobot describes. At EMIL Group I restructured an 18-person delivery organisation into three parallel lean teams, stabilising engineer retention and shipping the Claims Center from concept to production while simultaneously cutting time-to-market for new insurance products from months to under a week. Managing competing priorities across workstreams with different stakeholders and timelines is a mode I find energising rather than stressful.

I would welcome the opportunity to discuss how my experience translates to Jobot's specific product challenges. I am available at short notice and happy to provide references, a portfolio of past roadmaps and PRDs, or a more detailed walkthrough of any of the projects above.

Best regards, *Philipp Hilbert*
