

Philipp Hilbert. *Product Owner, OOH Platform & Locker.OS.*

Positioning, ten years owning backlogs in regulated, hardware-adjacent B2B environments, bringing the same structured delivery discipline to GLS/NXT's parcel-locker platform. ≤ 25 words.

Dear GLS/NXT team,

I am applying for the Product Owner role for the Locker.OS pillar. The role combines two things I find genuinely interesting: the operational complexity of running software on physical infrastructure at international scale, and the backlog discipline required to keep an engineering team unblocked when the product is still being defined. I have spent ten years doing exactly that, in environments where the cost of ambiguity shows up as a missed sprint, a broken integration, or a client who loses trust.

My most directly relevant experience is at Qcrypt AG, where I owned a product that combined custom hardware with a multi-layer software stack, shipping a three-minute installation path for enterprise buyers who would not tolerate longer. The challenge there was not technical, it was requirements: writing acceptance criteria tight enough that hardware and software behaved predictably together, and translating security constraints (quantum-resistant OTP encryption) into user stories an embedded engineer could act on. That is the same muscle Locker.OS needs: clear, hardware-aware requirements, and a backlog that reflects both the software behaviour and the physical deployment context.

At Rohde & Schwarz, I managed a cross-functional team of fifteen engineers and data scientists on the FCAS AI and data platform, running Scrum in Jira and Confluence across multinational teams. I redirected strategy mid-cycle based on instrumented workflow analysis, two competing designs, one recorded zero clicks, and delivered a GitOps rollout that cut deployment time from days to thirty minutes. At the Bundesagentur für Arbeit, I carried a full ETL migration, a UI relaunch, and a bare-metal-to-container migration through the same period without slipping delivery. These are not separate achievements; they reflect how I work: keeping engineering moving while absorbing strategic changes, and using data to justify the trade-offs.

The Locker.OS scope, a standardized software stack for GLS parcel lockers, serving international markets and a partner ecosystem, is a B2B platform problem at the infrastructure layer. My logistics specialisation from TU Berlin and my B2B SaaS experience at EMIL Group (insurance platform for insurers, reinsurers and brokers) give me the domain framing to speak sensibly with business stakeholders, while my technical fluency with APIs, containerized environments, and CI/CD pipelines means I can have a real conversation with engineering rather than relaying messages. I also bring comfort with AI tooling as a daily productivity lever, not a talking point, I use Claude Code, Copilot and Lovable routinely to draft specs, generate edge cases, and prototype quickly.

I am based in Berlin, hold EU citizenship, and can start within four weeks of an offer. I would welcome a conversation about the Locker.OS roadmap and where the pillar is today.

Best regards, *Philipp Hilbert*
