

Philipp Hilbert. *Product manager who turns ambiguous fintech requirements into shipped, measurable product.*

Positioning, ten years of end-to-end product ownership in regulated industries, now applying that rigour to investment platforms built on data and KPIs.

Dear XTB hiring team,

I am applying for the Product Manager role because the problem you are solving, keeping a complex, multi-asset investment platform coherent for over one million users while the product surface keeps expanding, is precisely the kind of constraint I find most interesting to work inside. A growing user base and a single, unified app are in direct tension: every new feature is a potential coherence debt.

My 13 years of product ownership have been almost entirely in regulated, data-heavy environments. At Bundesagentur für Arbeit I owned a national labour-market analytics platform where every indicator was a policy decision with visible downstream consequences, I learned quickly that "it seems to me" is not an acceptable justification for a roadmap choice. At EMIL Group I shipped the Claims Center from concept to production, cutting time-to-market for a new insurance product from months to under a week, while simultaneously restructuring an 18-person delivery organisation that was losing its senior engineers. Both situations required the same skill your posting names: justifying decisions with numbers and facts, then executing cleanly with a cross-functional team.

On the discovery side, I have run the full cycle, JTBD interviews, usability testing, stakeholder workshops, and I know how to distinguish a signal worth acting on from noise worth ignoring. At Rohde & Schwarz I instrumented two competing workflows before committing to a direction. One had a beautiful UI and exactly zero actual clicks; the other was plainer and was the one people used. That finding redirected several months of engineering effort. Discovery discipline is not a phase before development; it is a continuous risk-reduction practice that runs in parallel with delivery.

My fintech background includes founding Kvitt Payment Solutions, a mobile P2P payments product that ran inside the girocard ecosystem and was acquired by Sparkasse, and seven years of hands-on crypto and DeFi experience including perpetual futures, DEX aggregation, cross-chain bridging, and market-microstructure analysis. I track liquidity, execution quality, and market structure not as a hobbyist but as someone who has built tooling around them. That gives me genuine domain empathy for the users XTB serves.

I use AI tooling not as a novelty but as a productivity multiplier: Claude Code and GitHub Copilot for in-repo work, Lovable for rapid front-end prototyping, n8n for agentic workflow automation. I can move from a user insight to a testable prototype in hours rather than weeks, which compresses the discovery loop considerably.

I would be glad to walk through any of these projects in more detail. The work is concrete and the outcomes are measurable, which is, I think, exactly what you are looking for.

Best regards, *Philipp Hilbert*
