Dear Daira team,

I am applying for the Head of Product role. Daira is building something that most fintech companies only talk about: an AI-native service where the agents are doing real compliance work, not just populating form fields. That is a harder product problem than it looks, and it is the kind I want to work on.

My background fits this role directly. I have 13 years in B2B SaaS product management across regulated industries, insurance, public-sector analytics, defence AI, healthcare, and payments. I know what it takes to write requirements that survive first-round UAT, to keep a backlog two sprints ahead of the team, and to align engineers, business stakeholders, and end users around a shared definition of done. At Rohde & Schwarz I owned the AI and data platform for the FCAS programme, leading 15+ engineers and data scientists through Scrum while reducing rollout time from days to 30 minutes via GitOps. At CLINET Platforms I cut an undeliverable roadmap to its top 10% and watched user acceptance rise more than fivefold. Both outcomes came from the same discipline: agree on what success looks like before you build, then check whether it happened.

I have also built AI-native products myself. I use Claude Code, GitHub Copilot, Cursor, and Lovable daily, not as productivity tricks, but to prototype, spec, and pressure-test ideas before they reach engineering. I built construct8, a two-sided B2B marketplace, alone: LLM agents across the funnel, SQL-based conversion analysis, WhatsApp and Telegram as the product surface. I understand what agentic workflows actually cost to maintain, where they break, and how to design human-in-the-loop fallbacks that keep the product trustworthy.

The UAE SME market is a specific fit for me. I am actively targeting Dubai and willing to relocate, which means I would be on-site from day one, not adjusting from a different timezone. The fintech and SaaS regulatory context in the GCC is different from the EU, and I would spend the first weeks learning it properly. What I bring is the product discipline and AI-native execution capability that lets a small team ship a roadmap that holds together under scrutiny.

I would welcome a conversation about what the first quarter looks like and where you see the biggest product risk right now.

Best regards, *Philipp Hilbert*
