

Philipp Hilbert. *Pricing-domain Product Owner with a decade of B2B SaaS delivery.*

Positioning, ten years translating messy operational workflows into production software – now focused on pricing intelligence where domain complexity and delivery rigour both matter.

Dear hiring team,

I am applying for the Product Owner role at Simon-Kucher Engine. I have spent the past ten years doing exactly what this posting describes: taking ambiguous, multi-stakeholder business requirements and turning them into structured backlogs, testable acceptance criteria, and shipped software. The environments have been varied – a European defence programme, a public labour-market analytics platform, a B2B InsurTech SaaS, a hospital mobile app – but the core challenge has been consistent: translate complexity into clarity, and keep the delivery team moving.

The posting asks for someone who owns the end-to-end release lifecycle. At Rohde & Schwarz, working on the FCAS defence programme, I did exactly that for a multimodal AI data management platform: I owned requirements from discovery through GitOps-based rollout, introduced ArgoCD, and cut deployment times from several days to under forty minutes. At Emil Group, I inherited a 17-person team that had lost sprint discipline and client trust. I split the team into smaller Scrum units, reintroduced velocity tracking, ran weekly product workshops with the client, and reduced senior developer attrition from near-total to a single departure over my tenure. Both cases required the same skill the Simon-Kucher Engine role demands: knowing when to slow down and clarify, and when to push through and ship.

Pricing software is a new domain for me and I want to name that directly. What I bring is a decade of breaking down complex business logic – insurance product configuration, public labour-market indicators, secure government data pipelines – into requirements that engineers can act on and clients can validate. The structural problem is the same: a business rule that lives in a consultant's head or a client's spreadsheet needs to become a testable feature with clear boundaries. That translation is where I operate best.

Simon-Kucher occupies an interesting position: forty years of commercial strategy expertise now being expressed through products that scale and compound. That combination of domain depth and delivery ambition is more interesting to me than a pure-play SaaS shop, because the requirements engineering challenge is harder and the client impact is more direct. I would be joining a team that measures success by whether clients actually grow revenue – which is a more honest product signal than most.

I am based in Berlin, fluent in both German and English, available within four weeks of an offer, and genuinely curious about pricing as a discipline. I would welcome a conversation about the product and the team.

Best regards, *Philipp Hilbert*
