Dear Freenow team,

I am applying for the Product Manager role in your B2B Integration vertical. I have spent the better part of a decade doing one thing consistently: taking enterprise environments where process is broken or missing and building the product layer that makes them function at scale. That is not a generalisation – it is what I did at Emil Group, at Rohde & Schwarz, and at the Federal Employment Agency, each in a different sector but always with the same core problem: complex operational reality, teams that cannot wait for clarity, and a product person who has to create structure where none exists.

The Freenow posting describes automated booking workflows and non-app ordering experiences that replace manual processes. At Emil Group, the core challenge was identical in structure: insurers were managing product configuration through spreadsheets and phone calls, and the platform existed to replace that with parameterised, auditable, workflow-driven product issuance. I designed and delivered the Claims Center module from concept to production, rebuilt sprint discipline on a 17-person team that had lost delivery rhythm, and introduced structured communication practices that recovered client trust in a prototype-stage environment. That work required exactly the ability the job description names: defining structure where none exists, managing stakeholders without direct authority, and keeping engineering moving through documented, independent-buildable specifications.

At Rohde & Schwarz, I delivered autonomous feature sets within a multinational defence programme – writing user stories, acceptance criteria, implementation support, and GitOps rollout on a platform that had to satisfy data provenance and auditability requirements for government stakeholders. I unblocked an infrastructure issue in OpenShift independently, shipping a feature in one week that a project lead had been requesting from engineers for over a year. I mention this not to imply that infrastructure speed is relevant to this role, but because it

illustrates how I work in resource-constrained, cross-functional environments: I find the blocker, assess whether I can resolve it directly, and do not wait for permission to act.

On the B2B integration and API side specifically, I have worked across CGM API integration in hospital systems, REST API design in InsurTech, ETL pipeline product ownership with Dagster and dbt, and payment system product design including PSP integration at Kvitt. The common thread is comfort with backend workflow complexity and the discipline to document it clearly enough that engineering teams can build from the spec without repeated clarification.

My German is native and my English is C2. I am based in Berlin and open to the Hamburg or Barcelona office. I would welcome the chance to talk about the specific integration problems your enterprise customers are raising right now.

Best regards, *Philipp Hilbert*
