

Philipp Hilbert. *Enterprise SaaS Product Manager with a decade of mission-critical delivery.*

Positioning, ten years turning complex industrial and regulated workflows into shipped software, now bringing that discipline to Embrace's asset-intensive client base.

Dear Hiring Team at Embrace,

Industrial software lives or dies on precision. A requirements gap that would be a minor inconvenience in consumer software becomes a compliance risk or an unplanned shutdown when the client is a top-ten chemical producer or a major oil and gas operator. That reality is exactly what drew me to this role. I have spent the last several years working in environments with identical stakes: a European defence programme requiring full AI data provenance and auditability, a public analytics platform for Germany's Federal Employment Agency governed by strict IT security mandates, and a B2B InsurTech platform where a misconfigured underwriting rule can affect policy issuance across an entire product line.

At Rohde & Schwarz I owned the product of a central AI data management platform within the FCAS programme. I delivered autonomous feature sets end-to-end – user stories, acceptance criteria, implementation support, testing, and GitOps-based rollout – and unblocked an infrastructure issue in OpenShift that had been open for over a year, resolving it independently in one week. That is the kind of hands-on execution posture I bring to a PM role: I do not write tickets and wait; I move with engineers toward the problem. I cut deployment times from several days to under forty minutes by introducing ArgoCD, which gave the team a concrete signal that product and engineering were aligned on operational quality, not just feature delivery.

At Emil Group I inherited an InsurTech platform where sprint discipline had collapsed and a seventeen-person team had become a single, undifferentiated bottleneck. I split the team into structured Scrum units, reintroduced velocity tracking and formal refinement ceremonies, and rebuilt client trust through weekly product workshops. Senior developer attrition – which had been near-total – dropped to a single departure across my tenure. The job description asks for a PM who can act as the primary liaison between stakeholders and development teams while also

facilitating agile ceremonies and maintaining delivery velocity; that is an accurate description of what I did there.

Embrace's roadmap interest in intelligent workflow automation, predictive analytics, and inspection intelligence aligns directly with my recent work. At the Federal Employment Agency I introduced Dagster for automated ETL and indicator generation on a live labour market analytics platform, and I have spent the last year building personal infrastructure for algorithmic market analysis using agentic loops, backtesting pipelines, and multi-source data integration. I understand the PM work behind AI-enabled products not as a marketing position but as a concrete set of data quality, model governance, and user-facing explainability problems that need to be solved in the backlog.

I am remote-based in Berlin, aligned to UK working hours as the role specifies, and available with four weeks' notice. I would welcome a conversation about where the product portfolio stands today and where the highest-leverage opportunities are.

Best regards, *Philipp Hilbert*
