

Philipp Hilbert. *Product Owner, regulated software delivery.*

Positioning, hands-on Product Owner with ten years of backlog ownership, cross-functional alignment, and delivery in regulated, high-compliance environments.

To the Clario hiring team,

I am applying for the Product Owner role at Clario. The combination of SAFe delivery structure, regulated environment, and a mission tied to clinical evidence quality is the kind of context where my specific strengths – structured requirements engineering, backlog ownership under pressure, and cross-functional alignment – produce their clearest return.

At Rohde & Schwarz, I served as Product Manager on a European defence programme (FCAS) building a central AI and data management platform for multimodal datasets. The environment had significant compliance and audit requirements: every transformation pipeline needed full data provenance, every dataset modification needed a traceable trail, and every acceptance criterion had to hold under multinational stakeholder scrutiny. I delivered autonomous feature sets end-to-end – user stories through acceptance testing through GitOps rollout – and unblocked infrastructure-level issues that had been stalled for over a year. The parallel to Clario's regulated delivery environment is direct.

At Emil Group, an InsurTech SaaS platform serving primary insurers and reinsurers, I inherited a delivery process in crisis. A 17-person team had lost sprint discipline, velocity tracking had collapsed, and client trust was eroding. I split the team into functional Scrum units, reintroduced structured refinement and ownership models, and ran weekly product workshops to stabilise the client relationship. Within weeks, attrition dropped from near-total to a single departure and sprint predictability returned. I understand what backlog dysfunction costs and how to correct it without creating further disruption.

At the Federal Employment Agency, I operated as both Product Manager and deputy IT Security Officer on a public analytics platform. That dual role – delivery ownership alongside compliance governance – required me to hold the tension between moving fast on features and maintaining rigorous data lineage and governance standards. It is the same tension that exists in GxP-adjacent environments, and I am comfortable in it.

My gap relative to this role is direct clinical trial or eClinical software experience. What I bring instead is the structural discipline that makes regulated delivery work: audit-ready artefacts, change-controlled backlog management, and the stakeholder communication patterns that keep distributed teams aligned without losing execution speed. I am a fast domain learner, and the underlying mechanics of compliant software delivery are already well-established in my practice.

I would welcome a conversation about how the role is structured and where the biggest delivery challenges currently sit.

Best regards, *Philipp Hilbert*
