Dear Uberall hiring team,

I am applying for the Product Manager, Listings role because the domain matches the exact shape of work I have spent the last three years doing: owning complex technical integrations in B2B SaaS environments where data quality is not cosmetic but operationally critical, and where a broken API contract has direct consequences for paying customers.

At Rohde & Schwarz, I owned a central AI data management platform built on multimodal pipelines under a European defence programme. The core challenge was identical to what Uberall faces at a different scale: ensuring data entering the system from multiple external sources was clean, traceable, and compliant with contractually defined standards – and then maintaining that integrity as partner requirements evolved. I delivered this end-to-end, from writing user stories through to GitOps rollout using ArgoCD, while working across architect, data science, backend, frontend, and QA functions. At the Federal Employment Agency, I served as Deputy IT Security Officer while simultaneously owning the data transformation and indicator generation pipeline for a public-facing analytics platform, introducing Dagster for automated ETL and managing system-level Kubernetes upgrades without external support.

The 60+ integrations Uberall manages are, at their core, a distributed data quality problem with a partner relations layer on top. What breaks that system is usually not the happy path – it is the edge cases that emerge when a platform partner changes a field requirement quietly, or when a customer's data does not conform to what the integration expects. I am comfortable diving into API documentation, reproducing failures in a test environment, and translating what I find into a clear engineering brief. At Emil Group, I did this under significant delivery pressure: the team was mid-crisis when I arrived, and I stabilised delivery by restructuring a bloated seventeen-person team into focused Scrum units, reintroducing velocity tracking, and running weekly product workshops that rebuilt client trust enough to prevent a contract termination.

On AI fluency: I use Claude, GPT, and GitHub Copilot daily – not for optics but because they materially reduce the time between a discovery finding and a dev-ready spec. I am also actively

building a personal crypto infrastructure project involving agent-driven execution loops and data pipeline design, which keeps my systems instincts sharp outside working hours. The AI-enhanced data mapping and matching accuracy ideas called out in the job description are exactly the kind of problems I would want to tackle once I understand the current integration architecture well enough to improve it responsibly.

I would bring ten years of hands-on technical product ownership, a track record of stabilising delivery in high-complexity SaaS environments, and genuine interest in the problem Uberall is solving. I am available on four weeks' notice and happy to meet at whatever stage makes sense.

Best regards, *Philipp Hilbert*
