

Philipp Hilbert. *Technical Product Manager who maps complexity and ships.*

Positioning, ten years of translating ambiguous operational systems into dev-ready backlogs, now bringing that muscle to Ingenious Lion's emerging product landscape.

Dear Ingenious Lion team,

I am applying for the Product Manager role at the JAY! D Hub. The description lands with precision: a product landscape still being defined, an engineering team that needs a counterpart who holds context and translates requirements rather than hands off tickets, and a Business Product Manager who owns the client side while the Technical PM owns delivery. That division of labour is the model I have worked in throughout my career, and it is the model I find most effective.

At Rohde & Schwarz, I joined a defence-grade AI data platform mid-flight, under FCAS – a programme with multinational stakeholders, incomplete documentation, and months of accumulated technical debt. My first task was the same one this posting names: absorb what exists, map what is missing, and create a structure the team can execute against. Within the first weeks I had a written dependency map and a prioritised backlog with acceptance criteria. Within a month I had unblocked an infrastructure issue in OpenShift that had been open for over a year, delivered autonomously in one week. I am not citing that to impress – I cite it because it is the same mechanic this role requires: rapid comprehension of a complex system, followed by structured execution.

At Emil Group, the situation was different but the problem was recognisable. A 17-person team had lost sprint discipline under delivery pressure, client trust was eroding, and senior engineers were leaving. I split the team into smaller Scrum units, reintroduced velocity tracking and structured refinement, rebuilt weekly product workshops with the client, and reduced attrition from near-total to a single departure. The Business Product Manager / Technical PM dynamic described in this posting requires exactly that kind of dual attention: keeping the engineering side disciplined and the business side informed without either becoming the bottleneck.

At the Federal Employment Agency, I served as Deputy IT Security Officer alongside the PM role, owned a Kubernetes migration, and introduced Dagster for automated ETL pipelines on a

public-facing analytics platform. The combination of delivery management, technical depth, and stakeholder communication across non-technical audiences is not a stretch for me – it is how I have operated in every role.

On the AdTech and media domain: I do not have direct AdTech career experience, and I would rather name that clearly than obscure it. What I bring is strong pattern recognition across data-intensive platform products, and the ability to absorb a new domain quickly – which is precisely what the posting is asking for in the first weeks.

I am a German native, C2 English, based in Berlin, and available on four weeks' notice.

Best regards, *Philipp Hilbert*
