

Philipp Hilbert. *Payments PM who has shipped regulated, multi-stakeholder software from concept to production.*

Positioning, ten years of B2B SaaS product delivery, including payment flows, regulated platforms, and lean cross-functional teams – brought to bear on CardFlight's merchant growth agenda.

CardFlight's model – distributing through hundreds of ISOs and acquirers while simultaneously accelerating direct merchant acquisition – creates a product management problem I find genuinely compelling. The reseller channel imposes hard constraints on what you can ship and when. The merchant end is where the value is actually experienced. Holding both in the same roadmap, without letting one crowd out the other, requires exactly the kind of structured prioritization and clear cross-functional communication this role describes.

My most directly relevant experience is at Emil Group, where I managed an InsurTech B2B SaaS platform serving primary insurers, reinsurers, MGAs, brokers, and underwriters simultaneously – every release had to thread the same needle of channel partner readiness and end-customer value. I rebuilt sprint discipline on a 17-person team that had lost delivery stability, split it into focused Scrum units with ownership structures, and restored client trust through weekly product workshops and honest communication about technical complexity. That environment taught me that the most important PM skill in a multi-stakeholder channel business is writing a problem statement everyone agrees on before anyone writes a line of code.

At Rohde and Schwarz, working on a government-contracted AI data platform with multinational stakeholders, I owned feature delivery end-to-end: user stories, acceptance criteria, implementation support, testing, and GitOps rollout. I reduced deployment times from several days to under forty minutes by introducing ArgoCD, and I unblocked an infrastructure issue in OpenShift that had been open for over a year – delivered in one week by working directly in the codebase alongside engineers. The technical fluency was not incidental; it was what let me write requirements engineering teams could actually build from without constant clarification loops.

On the payments side, I co-founded Kvitt Payment Solutions, a group-based P2P payment product built on a P2P backbone with full PSP integration, UX design, and a mobile prototype – later acquired by Sparkasse. I understand how payment flows break, where edge cases live, and why the onboarding experience for merchants matters as much as the transaction logic underneath it. My experience does not include US acquiring or ISO channel mechanics specifically, and I want to name that directly. The structural problem – reconciling channel partner constraints with end-merchant needs inside a revenue-weighted roadmap – is one I have navigated repeatedly, and I would expect to close the domain gap quickly through the discovery calls and reseller conversations the role describes.

I work in a lean, autonomous style and have consistently operated as the person who clarifies the path when requirements are incomplete. I use AI tooling daily – not as a substitute for judgment but as a way to synthesize discovery inputs faster, generate edge cases before engineering asks for them, and move from problem statement to spec without unnecessary delay. That is the cadence CardFlight's four-person team needs. I would be glad to discuss how my background maps to the specifics of SwipeSimple's roadmap and the current acquirer channel.

Best regards, *Philipp Hilbert*
