Dear Recruiting Team,

I am applying for the Product Owner position focused on APIs, agile processes, and stakeholder management in the financial sector. With close to ten years of hands-on Product Owner and Product Manager experience – spanning regulated government programmes, B2B SaaS platforms, and infrastructure-level API work – I am well positioned to take ownership of both the product vision and the day-to-day delivery rigour this role requires.

The core of the role is exactly where I have operated most consistently: defining product concepts and business logic for API-driven systems, keeping agile processes sharp under delivery pressure, and maintaining trust with stakeholders who span technical, business, and compliance functions. At Rohde & Schwarz, I owned a central data management platform built on a microservices and Kubernetes stack, delivering autonomous feature sets end-to-end from user stories through GitOps rollout, including audit-trail and data provenance features that had to satisfy multinational programme requirements. At Emil Group, I stepped into a team that had lost sprint discipline and client confidence, rebuilt structured refinement and velocity tracking, and reduced senior developer attrition from near-total to a single departure – all while continuing to ship.

On the API side specifically, my background covers REST API integration from both the product consumer and the product owner perspective. At CLINET Platforms I managed complex legacy CGM API integration into hospital information systems with incomplete documentation and strict external dependencies. At AOK ITSCare I drove a Shopware migration that required mapping a custom catalogue API with configurable approval policies. I understand what makes an API product releasable – clear contracts, well-specified edge cases, and acceptance criteria that a developer can test against – and I know how to write requirements that reduce back-and-forth rather than generate it.

The startup-mentality requirement in the posting resonates directly with how I work. I am comfortable with short communication paths, I prefer direct alignment over escalation chains, and I treat ambiguity as a product constraint to be resolved rather than a reason to wait. My tooling reflects this: I use AI-native workflows daily to accelerate requirements writing, stakeholder documentation, and prototype iteration, which means I can move at a pace that matches fast-moving financial product teams.

I would welcome a conversation about the specific API domain and team structure. Please find my CV attached.

Best regards, *Philipp Hilbert*
