Dear HR Solutions GmbH,

I am applying for the Proxy Product Owner engagement for your public-sector client. The project brief describes a challenge I recognise from prior work: a heterogeneous system landscape in which structured and unstructured data arrive through multiple channels, legacy specialist applications act as routing and adapter layers, and no single coherent target architecture has yet been fully derived or documented. My role at Rohde & Schwarz on the FCAS AI data management platform involved precisely this combination – multimodal data ingestion, classification and transformation pipelines, metadata consistency across processing stages, and continuous alignment with multinational technical and domain stakeholders. I am comfortable in that environment and productive in it.

My experience as a Proxy PO at AOK ITSCare, where I managed the migration of an internal webshop to Shopware while navigating complex catalogue and API integration and customisable approval workflows, gave me a direct feel for what it means to represent the Product Owner's intent in operational day-to-day work without losing the strategic thread. At the Federal Employment Agency I served additionally as Deputy IT Security Officer, which reinforced my habit of treating governance and auditability not as overhead but as design constraints that improve a product's long-term maintainability. Both experiences taught me that in regulated and public-sector contexts the quality of written artefacts – Fachkonzepte, decision logs, interface definitions – determines whether work survives team changes and procurement cycles.

On the architectural side, the posting's focus on routing and orchestration approaches, metadata governance, and the derivation of a Soll-Fachkonzept aligns closely with work I have done in practice. At the Federal Employment Agency I introduced Dagster for automated ETL and indicator generation, standardised data lineage, and migrated legacy systems to Kubernetes. At Rohde & Schwarz I reduced deployment times from several days to under forty minutes by

introducing GitOps with ArgoCD, and I unblocked OpenShift-level infrastructure issues independently that had been pending with the engineering team for over a year. I mention these not to position myself as a developer, but to illustrate that I can hold a substantive conversation with architects and engineers about feasibility without needing translation.

The engagement runs through year-end with an extension option – a structure I am comfortable with. I am available from mid-July, can commit full-time, and am set up for predominantly remote work with the on-site availability described. I would be glad to discuss the details of the client context, the current maturity of the existing architecture documentation, and where I could contribute earliest value.

Best regards, *Philipp Hilbert*
