

Philipp Hilbert. *Digital assets product operator for institutional infrastructure.*

Positioning, ten years shipping complex financial software, now focused on the custody and settlement layer where tokenization meets institutional scale.

Dear Hiring Team,

State Street Custody is making a bet that institutional asset servicing will increasingly run on distributed ledger infrastructure, and needs product people who can hold both worlds at once: the operational rigour of a regulated custodian and the technical literacy to make tokenized workflows actually ship. That combination is where I have spent the last several years.

At Rohde & Schwarz I owned a data management platform inside the European defence programme FCAS. The environment was multi-stakeholder, multinational, and regulated, with requirements that arrived incomplete and shifted under delivery pressure. I delivered autonomous feature sets from user story through GitOps rollout, cut deployment times from several days to under forty minutes, and unblocked infrastructure problems that had been sitting on the engineering backlog for over a year. The discipline required – translating ambiguous operational needs into dev-ready specifications across business, engineering, QA, and compliance – is the same discipline digital asset product development at State Street demands.

At Emil Group I ran product for a B2B InsurTech platform where the selling proposition was collapsing insurance product time-to-market from over a year to under a week. That required understanding complex policy issuance and document management workflows in depth, rebuilding sprint discipline in a fragmented team, and re-establishing client trust in a prototype-stage environment through structured weekly workshops. The Claims Center module I delivered from concept to production rollout is a direct analogue to the kind of end-to-end feature ownership this role calls for.

On the digital assets side I bring eight years of hands-on experience across centralized and decentralized venues – custody models, DEX aggregation, perpetual mechanics, cross-chain bridging, oracle dependencies, and the stablecoin and settlement infrastructure that sits underneath all of it. I have studied market microstructure in detail, worked with liquidation analytics platforms, and built my own backtesting and agent framework in Python. This is not

surface-level familiarity; it is the kind of practitioner knowledge that lets me read a smart contract specification, understand an MPC custody architecture, or interrogate a tokenized collateral workflow without needing it explained from first principles. The gap I acknowledge honestly is that I have not held a product role inside a custodian specifically – but the operational and regulatory complexity I have navigated at the Federal Employment Agency and Bundesdruckerei is directly comparable.

State Street's position – serving asset managers, insurance companies, and official institutions globally – means the stakes of getting digital asset product development right are structural, not experimental. I am drawn to that weight. I want to build product that institutional investors can rely on, not product that sits in a sandbox. I would welcome the opportunity to discuss how my background maps to the specific pilots and roadmap priorities you are working on.

Best regards, *Philipp Hilbert*
