

Philipp Hilbert. *B2B SaaS Product Manager for complex operational workflows.*

Positioning, ten years owning product end-to-end in regulated, multi-stakeholder environments – built for the complexity of workforce scheduling software.

Dear shyftplan team,

Workforce planning in manufacturing environments is operationally dense in a way that most B2B SaaS products are not. Shift constraints, skill matrices, real-time absence handling, and regulatory requirements around working hours all interact simultaneously. I have spent ten years as a Product Manager and Product Owner turning exactly that kind of operational complexity into dev-ready requirements, and I would like to bring that experience to your product team.

At Emil Group I owned an InsurTech SaaS platform serving primary insurers, reinsurers, and MGAs – a domain with similarly interlocking rules, stakeholder hierarchies, and compliance constraints. I delivered a Claims Center module from concept to production, rebuilt sprint discipline after a period of delivery instability, and regained client trust through structured weekly product workshops. The operational complexity of insurance product configuration maps closely onto the scheduling domain: rules are dense, exceptions are frequent, and correctness is not negotiable. At Rohde and Schwarz I served as the sole PM on a defence-grade AI data platform under FCAS, where I delivered autonomous feature sets end-to-end – from user stories through acceptance criteria, implementation support, and GitOps-based rollout – within a cross-functional team of architects, data scientists, and engineers.

What stands out about shyftplan is the specificity of the problem. Dynamic adaptation to real-time absences is not a generic scheduling feature; it requires a product model that accounts for qualification requirements, shift coverage minimums, and notification flows simultaneously. I have mapped workflows of comparable complexity at the Federal Employment Agency, where I owned a labour market analytics platform and served as Deputy IT Security Officer, and at CLINET Platforms, where I built mobile-first patient management flows integrated with hospital information systems and legacy APIs. In both cases the critical skill was the same: translating ambiguous operational reality into precise, testable product definitions before a single sprint began.

I am a native German speaker with C2 English, based in Berlin, and available within four weeks. I am comfortable with Jira-based sprint ownership, enterprise account feedback cycles, and the direct CEO reporting structure you describe. I am not looking for a role with low accountability – I am looking for one where the product decisions I make have measurable consequences for real industrial customers.

I would welcome the opportunity to discuss how my background maps onto the specific product area you are hiring for.

Best regards, *Philipp Hilbert*
