Dear FLEX Capital team,

I am applying for the AI Product Manager role because the description maps cleanly to the work I already do. At Rohde & Schwarz I took an AI data platform from fragmented requirements to production in a government defence context, delivering autonomous feature sets end-to-end – user stories, acceptance criteria, implementation support, testing, and GitOps rollout – while coordinating across architects, data scientists, backend engineers, and QA. At the Bundesagentur für Arbeit I owned a public analytics platform and introduced Dagster-based ETL pipelines and Kubernetes migrations. At Emil Group I re-established delivery discipline inside a broken 17-person team, split it into functional Scrum units, and rebuilt client trust through structured weekly product workshops. These are not case studies I observed from the outside; I was the person accountable for the outcome.

The specific combination FLEX names – product thinking, technical proximity, and rapid prototyping with Cursor and Claude Code – is how I operate daily. I use Claude Code for in-repo refactors and spec generation, Cursor for iterative feature builds, Lovable for front-end PoCs that make trade-offs visible to non-technical stakeholders, and n8n for multi-agent workflow orchestration. I have also built my own agentic dev framework and crypto backtesting engine, which gives me grounded, failure-mode-aware experience with LLM-assisted development that goes beyond reading documentation.

The cross-portfolio structure at FLEX is genuinely interesting to me. I have worked in InsurTech, public-sector analytics, defence AI, healthcare, and payment infrastructure – not by accident but because I find the pattern-matching across industries intellectually productive. A PM who has seen how data quality problems manifest in a defence AI context and how sprint discipline collapses in a scaling InsurTech startup is better positioned to diagnose and unblock a new

portfolio company quickly. That breadth is usually a liability in a single-product company; at FLEX it is the asset.

My Python foundation is solid enough to build working PoCs and to read and critique production code, though I am not a full-stack developer. I am transparent about that boundary. What I bring is the ability to make technical options legible to business stakeholders, write requirements that engineers can act on without a second meeting, and prototype fast enough that discussions move from hypotheticals to concrete artifacts. That is where the FLEX role sits, and it is where I do my best work.

I am based in Berlin, immediately available for a conversation, and happy to bring a short prototype or requirements document as a practical work sample if that would make the evaluation more concrete.

Best regards, *Philipp Hilbert*
