Dear AVO Mobility team,

I am applying for the Senior Business Owner / Product Manager B2B role at Avocargo. The posting is honest about what it actually needs: someone who can map customer segments, define requirements, stay in direct contact with pilot customers, and move fast enough to matter at this stage of the company. That is a founder-mode job inside a product frame, and it is exactly the kind of role I have done best.

At Emil Group I joined an InsurTech B2B SaaS platform at the prototype stage – a 17-person team without sprint discipline, pilot customers losing confidence, and senior engineers leaving. Within weeks I had restructured the team into focused Scrum units, reintroduced velocity tracking, and was running weekly product workshops directly with the clients. I did not just manage the backlog; I was the main interface between what customers were telling us and what the team was building. By the time I left, attrition had stopped and the product was shipping reliably again. The mechanics of that situation – an early-stage B2B product, a small scrappy team, pilot customers who need to trust you before they scale – map closely to what Avocargo is doing now.

At CLINET Platforms I built a mobile-first hospital app from scratch with a small team under tight deadlines. The core skill there was the same: understand the operational reality the users actually live in, cut the backlog ruthlessly to the highest-leverage features, and communicate technical constraints to non-technical stakeholders without losing their trust. The cargobike B2B context is different but the shape of the problem is familiar: delivery businesses have real operational pressure, limited tolerance for friction, and zero patience for software that does not fit their workflows.

My academic background is in Industrial Engineering at TU Berlin, with a first master's-phase specialisation in logistics – supply chain, operations, and transport systems. It is not cargobike-specific, but it means I will not need to be taught the vocabulary of last-mile delivery, fleet

operations, or route economics. That context matters when you are mapping B2B customer segments and writing requirements that reflect how the businesses actually work.

I work AI-native: Claude and GPT for discovery synthesis and spec generation, Lovable and Framer for rapid prototyping, n8n for workflow design. I write enough code to unblock myself and to have credible conversations with developers. At Rohde and Schwarz I delivered a feature in one week that engineers had been asked to build for over a year – not because I am faster than engineers, but because I understood both the requirement and the implementation path well enough to close the gap myself.

I would be glad to talk through how I would approach the B2B segment mapping and the first pilot customer cycle. Thank you for reading.

Best regards, *Philipp Hilbert*
