Dear ADAC Hiring Team,

I am applying for the Senior Product Owner role for Digital Mobile Products. With nearly ten years of hands-on Product Ownership across regulated SaaS platforms, mobile apps, and multi-stakeholder environments, I am confident I can contribute immediately to the digital member experience ADAC is building.

The role description resonates directly with work I have done. At Emil Group, I owned a B2B InsurTech platform serving primary insurers, reinsurers, and brokers – a domain as cross-functional and stakeholder-dense as the one described here. After arriving into a delivery environment where sprint discipline had broken down and client trust was eroding, I restructured a bloated 17-person team into focused Scrum units, reintroduced velocity tracking and structured refinement, and ran weekly product workshops that directly rebuilt stakeholder confidence. That experience maps well onto the coordination demands between Pannenhilfe, Mobility, Versicherungen, Loyalty, and the other Fachabteilungen named in your posting. At CLINET Platforms, I delivered a mobile-first patient app across iOS and Android – managing backlog, team, and external API constraints simultaneously under a tight timeline.

The requirement for AI affinity is one I take seriously as a working practice rather than a credential. I use large language models daily for spec drafting, edge-case generation, stakeholder communication preparation, and rapid prototyping. I have built agentic workflow automation with n8n and use tools like Lovable and Framer to compress the gap between product idea and testable prototype. This lets me move from hypothesis to validated feature faster than a waterfall-oriented approach allows, which fits directly with the iterative, hypothesis-driven product culture described in the posting.

My technical fluency allows me to work at the interface of product and engineering without creating bottlenecks. At Rohde and Schwarz, I unblocked an infrastructure-level issue in OpenShift independently – delivering in one week what a senior engineer had been unable to complete in months. At the Bundesagentur für Arbeit, I served as Deputy IT Security Officer while simultaneously managing a Kubernetes migration and a new Dagster-based ETL pipeline. I am not a developer, but I understand the systems well enough to write precise requirements, catch integration risks early, and reduce back-and-forth in refinement.

I am a German native speaker and operate at C2 level in English – switching between the two mid-meeting is standard for me. I am open to relocating to Munich, and I am available within four weeks of an offer. I would welcome the opportunity to speak in more detail about how my background maps onto ADAC's current product priorities.

Best regards, *Philipp Hilbert*
