Dear Bloomwell team,

I am applying for the Product Owner role because the problem you are solving – making evidence-based cannabis therapy accessible at scale through a digital, patient-centred platform – is one I find genuinely worth the effort. The combination of regulatory complexity, multi-sided marketplace dynamics (patients, physicians, pharmacies, wholesale), and the technical depth required to make eRezept and telemedical workflows actually work in production is not a problem that tolerates shallow product management. It suits someone who can sit comfortably in both a clinical workflow conversation and a sprint refinement session with backend engineers.

My most directly relevant experience is at CLINET Platforms, where I built a mobile-first pilot app for hospitals: digital anamnesis, therapy and meal plans, patient document storage, and a full CGM interface integration into hospital information system workflows. The challenge there was not only technical – it was translating highly regulated, paper-heavy clinical processes into a mobile UX that felt lightweight to patients while remaining auditable to clinicians. The structural problem is analogous to what Bloomwell faces: getting a regulated healthcare flow to feel as frictionless as a consumer app. At Emil Group I rebuilt sprint discipline in a 17-person team that had lost delivery velocity under scope pressure, split it into focused Scrum units, introduced ownership concepts, and regained client trust through structured product workshops. Stable delivery rhythm in a fast-moving environment is something I have had to rebuild from scratch, not just maintain.

On the requirements side, I have spent years converting ambiguous stakeholder input – government ministries, insurance carriers, defence programme stakeholders, hospital administration – into dev-ready user stories with acceptance criteria that engineering can actually build against. I understand that the gap between what a stakeholder describes and what

a developer implements is where most product quality is lost, and I take structured requirements engineering seriously as a core discipline rather than a formality.

I bring working technical fluency across the stack your platform likely runs on: REST APIs, Kubernetes, Python backends, and CI/CD pipelines. This means I can have a real conversation with your engineering team about what a proposed feature costs to implement, where the integration risk sits in a pharmacy API connection, or why a proposed data structure will create a compliance problem downstream. That technical grounding reduces back-and-forth and helps the team move faster.

I would welcome the opportunity to discuss the role in more detail. I am based in Berlin, comfortable working remote, and available to start within four weeks of an offer.

Best regards, *Philipp Hilbert*
