

Philipp Hilbert. *Financial protection systems, end-to-end.*

Positioning, ten years of platform PM experience shipping fraud-adjacent, compliance-heavy products now focused on the financial integrity layer of one of Europe's largest delivery networks.

To the Global Anti Fraud Product team at Delivery Hero,

The role asks for a product manager who can anchor anti-fraud products on global benchmarks while localising them to market realities – and who can use ML and data, not just describe them. That combination is more specific than it first appears, and it is one I have been building toward across several prior engagements.

At Rohde & Schwarz, I owned the data provenance and audit trail architecture for a multimodal AI platform inside a defence programme. The problem was not unlike fraud detection: the system needed to produce decisions that were both correct and explainable, with full traceability from raw input to model output. I drove the evaluation framework (SafeAI, ExplainableAI), introduced reproducible transformation pipelines, and delivered features end-to-end from user story to GitOps rollout – including unblocking an infrastructure issue that had stalled engineers for over a year. At the Federal Employment Agency I served as Deputy IT Security Officer alongside the platform PM role, which meant I was routinely bridging compliance, data governance, and feature delivery at the same time.

Earlier, at Kvitt Payment Solutions, I built the product from the ground up: P2P payment flows, PSP integration, full UX from prototype to mobile app, and the edge-case handling that determines whether a payment system is trusted or avoided. That product was later acquired and operated by Sparkasse. At Qcrypt AG I owned a quantum-secure encryption product aimed at non-technical users, which required me to think carefully about the trust interface – how do you make a high-assurance security product feel effortless? That question is structurally identical to the one Delivery Hero's anti-fraud team faces: how do you protect transactions without making legitimate users feel suspected.

My AI-native working style is directly relevant here. I use Claude and GPT daily for spec drafting and edge-case generation, GitHub Copilot and Cursor for in-repo investigation, and n8n for agentic workflow prototyping. I have also built my own crypto market research

infrastructure – a backtest engine and bot framework – which involves exactly the kind of feature engineering, signal validation, and data pipeline thinking that ML-based fraud detection depends on. This is not background knowledge; it is how I work.

Delivery Hero's scale – 65 countries, marketplace economics, profitability pressure – is the environment where shallow PM practice fails and operational depth pays off. I would like to bring mine to this team.

Best regards, *Philipp Hilbert*
