Dear Boardwise team,

Governance software for board offices sounds niche until you look at what it actually requires: workflow logic for multi-stakeholder approval chains, document intelligence, role-based access for people who are not power users, and increasingly, AI features that have to be explainable to a compliance-conscious audience. That combination is harder to specify than most enterprise SaaS, and it rewards a Product Owner who can hold complexity without adding it.

That is the work I have been doing. At Rohde & Schwarz I owned an AI and data management platform inside the FCAS defence programme, where stakeholders included multinational engineering teams, data scientists, and compliance reviewers. I wrote the user stories, set the acceptance criteria, supported implementation, and handled the GitOps rollout myself when the engineering queue was blocked. At Emil Group I inherited a bloated 17-person team, split it into smaller Scrum units, reintroduced velocity tracking, and ran weekly product workshops to rebuild client trust in a prototype-stage product. Both environments required exactly what Boardwise is asking for: translating board-level and management-level language into technically precise, shippable increments.

The Microsoft ecosystem requirement is concrete for me. At the Federal Employment Agency I worked within an Azure-adjacent infrastructure stack, managed Kubernetes-based deployments, and coordinated with identity and compliance teams. I understand M365 and Azure not as marketing checkboxes but as constraints that shape what a backlog item can realistically deliver in a sprint. When the job description mentions Copilot and LLM-based features, I read that as active integration work requiring someone who can evaluate feasibility honestly and write acceptance criteria that survive contact with an API's actual behaviour.

I am based in Berlin, hold German citizenship, and am genuinely comfortable with the async-remote model. My communication in both German and English is at native and C2 level respectively – I have a public English-language product pitch on YouTube from my time at Qcrypt AG if that is useful evidence. I can start within four weeks of an offer.

I would welcome a conversation about how the AI feature roadmap is currently structured and where the biggest translation gap sits between business intent and technical delivery.

Best regards, *Philipp Hilbert*
