

Philipp Hilbert. *Data & Connectivity Product Owner for analytical software platforms.*

Positioning, ten years translating complex operational workflows into dev-ready backlogs, now bringing that discipline to Agilent's Data Fabric and connectivity layer.

Dear Hiring Team,

I am writing to apply for the Data & Connectivity Product Owner role at Agilent Technologies. The combination of API gateway ownership, data transformation services, and the expectation that the successful candidate can move fluidly between business strategy and engineering execution describes work I have been doing for the last several years – most recently in a regulated, defence-grade data platform environment at Rohde & Schwarz.

At Rohde & Schwarz, I owned the product backlog for a central AI and data management platform within the FCAS defence programme. The platform ingested multimodal datasets, applied filtering and tagging pipelines, and maintained full data provenance and audit trails so that downstream ML training and evaluation were reproducible and explainable. I delivered feature sets end-to-end – writing user stories and acceptance criteria, supporting implementation, and managing GitOps-based rollout with ArgoCD – reducing deployment times from several days to under forty minutes. The work required constant cross-functional alignment across architects, data scientists, backend engineers, frontend engineers, QA, and multinational stakeholders with regulatory expectations. That is the same cross-functional surface area the Agilent role describes.

Before that, at the Federal Employment Agency, I owned the product backlog for the Arbeitsmarktmonitor, a public analytics platform. I introduced Dagster for automated ETL and indicator generation, managed structured data and transformation pipelines using dbt and DuckDB, and served as Deputy IT Security Officer with responsibility for compliance and data lineage. The fit with Agilent's Data Fabric scope – structured data, file management, transformation services – is direct.

At Emil Group, I inherited a product in client-trust deficit and a bloated 17-person scrum team with collapsed sprint discipline. I split the team into smaller, accountable units, reintroduced velocity tracking and structured refinement, and rebuilt client trust through weekly product workshops and transparent communication about technical complexity. I mention this because the Agile posting names continuous improvement of Agile delivery processes and fit-for-use testing as explicit responsibilities – these are not aspirational for me; they are patterns I have applied under pressure.

I do not have hands-on experience with LIMS, CDS, or ELN systems specifically, and I want to name that clearly. What I bring is deep platform PM experience in regulated data environments, strong Agile delivery practice, and the technical fluency to engage engineering teams on architecture questions without losing the customer workflow perspective. I am confident that laboratory-informatics domain knowledge follows quickly when the structural skills are already in place.

I would welcome the opportunity to discuss how my background maps to the Data Fabric and Connectivity team's current priorities.

Best regards, *Philipp Hilbert*
