

Philipp Hilbert. *Platform PM who ships AI infrastructure, not just roadmaps.*

Positioning, product manager with ten years of cross-functional delivery experience, ready to own the "AI as a Platform" layer at a regulated European fintech at scale.

Dear Hiring Team,

The role of Product Manager for the AI Platform at Scalable Capital is interesting to me for a specific reason: the work described is not "add AI features" but "build the infrastructure layer that makes AI trustworthy and consumable at scale inside a regulated institution." That is a harder and more precise problem, and it is the kind I have been working on.

At Rohde & Schwarz I owned the data management platform for a multimodal AI training system inside the FCAS defence programme – a context where data provenance, audit trails, SafeAI and ExplainableAI compliance were contractual requirements, not optional. I delivered autonomous feature sets end-to-end, reduced deployment cycles from several days to under forty minutes via GitOps, and served as the cross-functional interface between data scientists, backend engineers, architects, and multinational stakeholders. The platform I built there had to be consumed by domain teams who had no interest in the infrastructure layer – which is exactly the internal-developer-experience challenge your posting describes.

At the Federal Employment Agency I served concurrently as Product Manager and Deputy IT Security Officer on a public data analytics platform, which required me to hold governance and compliance thinking at the same level as delivery. I introduced Dagster-based ETL pipelines, managed Kubernetes migrations, and standardised CI/CD with full test integration – while keeping a cross-functional team aligned on a complex regulatory data environment. The combination of platform ownership and compliance responsibility in a single PM role is not common; I have done it.

At Emil Group I took over an InsurTech SaaS platform in a state of delivery breakdown and re-established sprint discipline, split an unmanageable seventeen-person team into effective Scrum units, and rebuilt client trust through structured weekly product workshops. That experience sharpened my thinking about what it takes to make a platform team legible and reliable to the

internal teams depending on it – which is the "easy-to-integrate services for all internal domain teams" goal named in your job description.

On the AI tooling side, I work daily with Claude, GPT, GitHub Copilot, and Claude Code for spec generation, edge-case analysis, implementation support, and in-repo refactoring. I have built a file-queue-based autonomous agent framework for my own crypto research and backtesting work, which has given me practical exposure to agent loop design, trace inspection, and the evaluation problems that arise when LLM outputs need to be trusted in downstream systems. I understand the gap between "the model responded" and "the model responded correctly and we can prove it."

I am based in Berlin and open to relocating to Munich. I am an EU citizen and need no sponsorship. I would welcome a conversation about the role.

Best regards, *Philipp Hilbert*
