Dear Cint Product Team,

I am applying for the Senior Product Manager, Exchange AI role. The framing in your job description – "reshaping the Exchange around agentic delivery of insights" – is not a phrase most companies use accurately. The fact that Cint uses it as the organising principle of this role, rather than as marketing language, tells me the organisation has already done the hard conceptual work of understanding what agentic systems actually require: clear data provenance, disciplined routing logic, and product owners who can hold both the vision and the implementation detail simultaneously.

My most relevant recent work is the AI and data management platform I built as Product Manager at Rohde & Schwarz under the FCAS defence programme. The core challenge there was identical in structure to Cint's: take multimodal datasets flowing in from heterogeneous sources, impose quality, tagging, and reproducibility discipline, and make the result usable by downstream ML pipelines – with full audit trails so stakeholders across government and industry could trust the outputs. I delivered autonomous feature sets end-to-end, including a GitOps-based rollout that reduced deployment times from several days to under forty minutes. I also unblocked an infrastructure-level issue in OpenShift independently, shipping in one week a feature that had been blocked for over a year. I mention this not to catalogue heroics but to illustrate that I operate at the boundary between product and engineering, which is exactly where agentic platform work lives.

At the Federal Employment Agency I owned the Arbeitsmarktmonitor analytics platform, introducing Dagster for automated ETL pipelines and dbt for indicator generation, while also serving as Deputy IT Security Officer. The overlap with Cint's Exchange is structural: a high-frequency data system where quality, lineage, and governance are not optional layers but load-bearing ones. At Emil Group I rebuilt delivery stability for a 17-person InsurTech team under client pressure, splitting it into focused Scrum units and recovering client trust through

structured weekly product workshops. I know what it feels like to manage a complex stakeholder map across commercial, engineering, and legal counterparts simultaneously.

On the agentic side specifically: I have designed multi-agent orchestration workflows using n8n and file-queue-based agent loops, used Claude and GPT daily for specification and edge-case generation, and built a personal backtesting and trading-agent framework in my own time. I am not describing AI as a future capability – it is the way I work now.

Cint operates at a scale – 300 million respondents, 130 countries – where marginal improvements in Exchange intelligence compound across every transaction. That is the kind of leverage I find genuinely motivating, and the kind of problem I am equipped to work on from day one.

Best regards, *Philipp Hilbert*
