Dear Affinidi team,

The Trust Fabric problem statement you have written – giving AI agents verifiable identity, policy guardrails, and real-time observability so organisations can move from PoC to governed production – is one I recognise from the inside. At Rohde & Schwarz I owned the AI data management platform for the FCAS defence programme, where the core product challenge was identical in structure: how do you make multimodal AI training data trustworthy enough that downstream decisions can be audited, reproduced, and defended to multinational stakeholders? The answer I built there – reproducible transformation pipelines, full data provenance, SafeAI and ExplainableAI evaluation concepts, and GitOps-based rollout – is the same class of thinking that Trust Fabric applies to agent identity and policy enforcement.

Earlier, as Product Owner at Qcrypt AG, I owned a quantum-secure encryption product where the design constraint was that users needed zero cryptographic knowledge to operate it. That constraint – making serious security infrastructure invisible to the person deploying it – is directly analogous to what a developer-facing verifiable credential product needs to achieve. I also served as deputy IT security officer during that period, which gave me a practical grounding in attack vectors, key management, and compliance governance that I have carried into every role since.

I am comfortable in the ambiguity you describe. At Emil Group I inherited a 17-person team that had lost sprint discipline, was haemorrhaging senior developers, and had broken trust with a key client. I split the team, reintroduced structured refinement, ran weekly product workshops directly with the client, and recovered the delivery track within two months. At the Federal Employment Agency I served simultaneously as Product Manager and Deputy IT Security Officer, owning both feature delivery and compliance governance for a public analytics platform serving regional labour market data. In both cases the challenge was the same one your posting

names: take ownership of something that does not come with a playbook, bring structure, and maintain momentum while direction continues to evolve.

On the technical side, I can engage at the level your engineering team will expect. At Rohde & Schwarz I unblocked an infrastructure-level OpenShift issue independently and delivered a feature in one week that the project lead had been requesting from engineers for over a year. I work daily with AI-native tooling – Claude, GPT, GitHub Copilot, Cursor – for spec generation, edge-case analysis, and implementation support. I understand how APIs, distributed systems, and identity flows are designed and where they fail in production.

Affinidi is building infrastructure that will matter. The ability to put governed, auditable AI agents into enterprise production is not a feature; it is what converts the current wave of AI investment from speculative to operational. I want to help build that, and I believe the combination of technical depth, delivery ownership, and security product experience I bring is a strong fit for the Senior Product Manager role on the Trust Fabric team.

Best regards, *Philipp Hilbert*
