Dear shyftplan team,

I am a Berlin-based Senior Product Manager with six years of B2B SaaS experience and a background in industrial engineering from the TU Berlin, where my first master's-phase specialisation was logistics and operations. When I read shyftplan's description – automating complex shift planning, estimating workforce and qualification demand, adjusting dynamically to real-time absences – I recognised problems I understand at a structural level, not just as product abstractions.

My most directly relevant experience is at Emil Group, where I owned the full InsurTech SaaS platform covering product configuration, underwriting, policy issuance, and workflow automation for primary insurers, reinsurers, MGAs, and brokers. The operational workflows were dense, the stakeholder set was heterogeneous, and the delivery environment had deteriorated: a 17-person team without sprint discipline, no velocity tracking, and near-total senior developer attrition. I split the team into smaller Scrum units, reintroduced structured refinement, and rebuilt client trust through weekly product workshops. That combination – workflow ownership, agile restoration, and stakeholder credibility – is the profile you are describing for this role.

At Rohde & Schwarz I operated inside a government defence programme (FCAS) where the product was an AI and data management platform for multimodal datasets. I delivered feature sets end-to-end: user stories, acceptance criteria, implementation support, testing, and GitOps rollout. I reduced deployment times from several days to under forty minutes by introducing ArgoCD, and I unblocked an infrastructure-level problem independently that had been stalled for over a year. The habit of going deep enough to unblock engineering is one I carry into every product role.

At the Federal Employment Agency I served simultaneously as Product Manager and Deputy IT Security Officer, which meant keeping delivery velocity high while maintaining compliance, data

lineage, and governance standards. I introduced Dagster for automated ETL pipelines and migrated the platform to Kubernetes. I mention this because shiftpplan's product – workforce scheduling for industrial clients – sits in a domain where data accuracy and auditability are not optional extras. The skills transfer directly.

I am already in Berlin and interested in the on-site collaborative environment you describe in Kreuzberg. I would welcome the opportunity to speak with you about the specific product area you would assign and the current state of the roadmap.

Best regards, *Philipp Hilbert*
