

Philipp Hilbert. *Logistics-domain PM with a decade of cross-functional delivery.*

Positioning, hands-on PM with operational workflow depth, Agile delivery track record, and logistics academic grounding – ready to own AUTO1's logistics engine end-to-end.

Dear Marija, dear AUTO1 hiring team,

I am applying for the Product Manager, Logistics role. My interest is grounded in a specific overlap: your logistics engine is a software system that has to model a physical, time-sensitive, multi-party process with full transparency – and that is precisely the class of problem I have spent the last several years solving as a PM. At Rohde & Schwarz I owned a data management platform built under a European defence programme, where the stakes of incorrect data lineage were compliance and safety failures, not missed deliveries. At the Federal Employment Agency I owned an analytics platform processing regional labour market data for public-sector stakeholders distributed across Germany. In both cases the challenge was the same: operational complexity that outpaced the documentation, and engineering teams that needed a PM to bridge the gap between what the business actually needed and what could be built.

What I find technically compelling about the AUTO1 logistics engine specifically is that it sits at the intersection of fleet-level coordination, third-party transport partners, and customer-facing delivery promises. That architecture produces a particular class of product challenge – distributed state, async updates, fallback handling, and SLA traceability – that I genuinely enjoy working in. My Master's specialisation at TU Berlin was logistics, covering supply chain, operations, and transport systems, so I come to the domain with conceptual vocabulary, not just analogies from adjacent fields.

On the delivery side: at Emil Group I inherited a 17-person Scrum team that had lost sprint discipline under prolonged delivery pressure. I split it into smaller, clearly scoped units, reintroduced velocity tracking and structured refinement, and recovered client trust through weekly product workshops and honest communication about technical complexity. The situation required diagnosis before action, and the willingness to restructure rather than optimise what was not working. I expect a similar discipline to matter inside a logistics PM role

at scale – the temptation to patch a backlog is always easier than restructuring how work gets refined.

I am comfortable working with complex data models and making trade-offs between technical debt and feature delivery. At the Federal Employment Agency I served as Deputy IT Security Officer alongside my PM duties, which required me to understand compliance requirements deeply enough to make informed product decisions rather than defer every question to legal. I have shipped production work in Kubernetes-based environments, introduced GitOps tooling that reduced deployment times from days to under an hour, and written acceptance criteria tight enough that engineers could build without back-and-forth on ambiguity.

I would be glad to talk through how my experience maps to the specific problems your logistics team is working on. I am based in Berlin, available on four weeks' notice, and authorised to work in Germany and the EU without sponsorship.

Best regards, *Philipp Hilbert*
