

Philipp Hilbert. *Technical Product Owner for complex transport and AI systems.*

Positioning, experienced Product Manager with a decade of structured requirements engineering and SAFe-adjacent delivery, ready to build greenfield scheduling platforms from the ground up.

Dear Hiring Team,

I am applying for the Technical Product Owner role on the transport systems and AI scheduling platform. The combination of a greenfield scope inside a newly forming Agile Release Train and explicit AI integration as a goal is not something I encounter in most Product Owner postings, and it is precisely the kind of situation I have navigated most effectively.

At Rohde & Schwarz I owned a central AI and data management platform for the European defence programme FCAS from inception. Requirements were incomplete, the stakeholder landscape was multinational and politically sensitive, and the architecture was evolving in parallel with the backlog I was building. I delivered autonomous feature sets end-to-end – user stories, acceptance criteria, implementation support, testing, and GitOps-based rollout – and unblocked infrastructure issues independently when engineer bandwidth was unavailable. Reducing deployment times from several days to 20–40 minutes through GitOps with ArgoCD is one concrete artefact of that ownership posture. That is the technical depth and delivery agency I would bring to defining the timetable platform scope from the ground up.

At the Federal Employment Agency I served as Product Manager for a public-sector analytics platform and simultaneously held the deputy IT security officer role. Both the compliance awareness and the institutional communication patterns of a large German public-sector environment are therefore familiar territory for me, not a new context to adapt to. I also hold a Diplom Wirtschaftsingenieur from TU Berlin with a logistics specialisation, which means the domain vocabulary of transport system planning – scheduling, capacity, routing, operational constraints – is a foundation rather than a gap.

The posting specifically calls for experience in scaled agile frameworks. At Emil Group I restructured a bloated 17-person team into focused Scrum units, reintroduced velocity tracking,

and rebuilt delivery stability in an environment where sprint discipline had broken down under client pressure. That is a different manifestation of SAFe-adjacent scaled agile work than a formal ART, but the underlying skills – dependency management across teams, PI-level sequencing, stakeholder expectation management – transfer directly to the environment you are describing.

I work entirely in German professionally and have done so across public-sector clients, government contracts, and regulated industries throughout my career. I am based in Berlin and fully comfortable with the 80 percent remote, one day Frankfurt on-site model.

I would welcome a conversation about the platform architecture that is already in scope and where the backlog work needs to start.

Best regards, *Philipp Hilbert*
