

Philipp Hilbert. *Regulatory technology product operator, precision-delivery focus.*

Positioning, product manager who turns complex regulatory requirements into dev-ready specs and shipped data engineering solutions, fast.

Dear Scalable Capital team,

Regulatory technology product management sits at an unusual intersection: you need someone who can sit with a compliance officer, understand what an upcoming regulation actually requires, and then immediately turn that understanding into a spec a data engineer can act on. That translation layer – from regulatory intent to technical implementation – is where I have spent the last several years, across government defence programmes, public data platforms, and B2B SaaS environments.

At Rohde & Schwarz, I delivered a central AI data management platform for the FCAS defence programme, where data provenance, audit trails, and governance were non-negotiable requirements set by multinational stakeholders with no tolerance for ambiguity. I owned the entire product cycle: from eliciting requirements across architects, data scientists, and compliance-adjacent stakeholders, through writing the acceptance criteria, to GitOps-based rollout. When the project was stalled by an infrastructure blocker that engineers had not resolved in months, I unblocked it independently and delivered the feature in one week. That combination of structured requirements work and hands-on delivery is what I would bring to your regulatory data architecture.

At the Federal Employment Agency, I served as Deputy IT Security Officer while also owning the data platform product. I introduced Dagster for automated ETL and indicator pipelines, migrated legacy systems to Kubernetes, and standardised data lineage practices. Working across compliance, engineering, and operations simultaneously is the normal operating mode I am accustomed to – not an edge case.

Your posting specifically values execution speed alongside diligence, which is a real tension that most organisations resolve in one direction or the other. My approach is to invest heavily in requirements quality upfront – structured discovery sessions, precise acceptance criteria, explicit edge cases – so that engineering can move fast without rework. At Emil Group, this

approach re-established delivery stability for a team that had lost both velocity and client trust, and reduced senior developer attrition from near-total to a single departure.

I am a German native speaker, based in Berlin, and open to relocating to Munich. I understand Scalable Capital's platform across Broker, Wealth, Credit, and Banking well enough to know that the regulatory surface area is genuinely complex and consequential. I would welcome a conversation about how the role is currently structured and where the biggest open items are.

Best regards, *Philipp Hilbert*
