Dear n8n team,

I have been running n8n workflows for multi-agent orchestration in my own tooling, so this application comes with hands-on context rather than slide-deck familiarity. What drew me to the Enterprise PM role specifically is the nature of the problem: helping engineering teams treat automation with the same rigour as software – versioning, environment promotion, rollback, observability – is infrastructure product work, and that is the territory I know best.

At Rohde & Schwarz, I owned the product for a central AI and data management platform inside the FCAS defence programme. The core challenge was identical in structure to what n8n faces at enterprise scale: workflows that started as prototypes needed to become auditable, reproducible, and operable by teams who did not build them. I introduced GitOps with ArgoCD and reduced deployment times from several days to twenty minutes. I unblocked infrastructure-level issues in OpenShift independently and delivered in one week a feature the project lead had been requesting from engineers for over a year. That pattern – close the gap between what engineering can see and what operators need to trust – is directly what the workflow lifecycle management and observability pillars of this role require.

At the Federal Employment Agency, I served as Deputy IT Security Officer while simultaneously advancing the Arbeitsmarktmonitor analytics platform. I introduced Dagster for automated ETL, standardised CI/CD with full test integration, and migrated legacy systems to Kubernetes. Working across compliance, governance, data lineage, and feature delivery simultaneously gave me a durable intuition for where enterprise-grade reliability requirements actually originate – they come from the audit trail, the secrets management, the configuration drift, and the absence of rollback, not from a checklist.

At Emil Group, I stepped into a prototype-stage InsurTech environment where sprint discipline had collapsed and client trust was at risk. I split a bloated seventeen-person team into focused Scrum units, reintroduced velocity tracking, and rebuilt the delivery rhythm. I also regained

client trust through structured communication and weekly product workshops. That experience sharpened my conviction that influence without authority is not a soft skill – it is the operational core of enterprise product management, where engineering, sales, solutions engineering, and customer success all have legitimate claims on prioritisation and none of them report to you.

The n8n Enterprise PM role sits at the exact intersection of developer experience, production operations, and cross-functional alignment that I have been working in across all three of those engagements. I am fluent in Git-based workflows, comfortable making tradeoffs between usability and implementation complexity, and experienced enough with Kubernetes and GitOps to have substantive architecture conversations with engineers rather than just transcribing them. I would be glad to walk through any of the specifics in a conversation.

Best regards, *Philipp Hilbert*
