Dear Trinetix hiring team,

I am applying for the Product Manager role because the combination of enterprise client work, offshore team coordination, and explicit AI tooling expectations matches the way I have been working for the past several years – not as an aspiration but as a current practice.

At Emil Group, I joined an InsurTech SaaS platform where delivery had stalled, client trust had eroded, and a 17-person team was operating without clear ownership. Within weeks I restructured the team into smaller Scrum units, reintroduced velocity tracking and structured refinement, and rebuilt client confidence through weekly product workshops. The Claims Center module went from concept to production rollout during my tenure. That kind of stabilisation work – diagnosing where the delivery system is broken, not just where the backlog is incomplete – is something I find genuinely engaging.

At Rohde & Schwarz I was embedded in a European defence programme, building a central AI data management platform for multimodal datasets. The environment was technically complex, the stakeholders were multinational, and the requirements were never fully stable. I delivered autonomous feature sets end-to-end – from user stories through implementation support to GitOps rollout – and reduced deployment times from several days to under forty minutes by introducing ArgoCD. I also unblocked an infrastructure issue in OpenShift that had been stalling the team for over a year, resolving it independently in a single week. The audit trail and data provenance work I owned there maps directly onto the compliance and traceability concerns I see in Audit and Tax domain software.

The AI tooling expectation in your posting is specific – Claude Code for prototyping and validation – and I want to be direct: I use it daily. For in-repo spikes, for edge-case generation against acceptance criteria, and for building rapid showcases that let non-technical stakeholders react to something concrete rather than a slide. Combined with Lovable for front-end prototypes and n8n for workflow automation, I can compress the discovery-to-feedback loop significantly, which matters when enterprise clients are paying for results, not process.

On offshore coordination: I have managed cross-functional delivery across distributed teams including engineers, data scientists, architects, QA, and compliance stakeholders in different timezones. The discipline I bring is structured asynchronous communication, clear acceptance criteria, and a bias toward shipping something reviewable rather than debating abstractions in meetings.

I would welcome the opportunity to discuss how I could contribute to Trinetix's enterprise delivery work. I am available for a conversation at short notice.

Best regards, *Philipp Hilbert*
