Dear PlanD team,

The combination you are building is specific and credible: a domain-vertical ERP with genuine product-market fit, a clear path to ten million ARR, and a founder-led mandate to make AI a structural part of how the product works, not just a marketing claim. That is the kind of product problem I find most interesting, and it is the environment I have been preparing for across the last decade of product work.

My most directly relevant experience is the Rohde & Schwarz engagement: a greenfield AI data platform, government-grade complexity, a cross-functional team spanning architects, data scientists, backend and frontend engineers, and QA, and a delivery culture that rewarded autonomous execution over committee approval. I shipped autonomous feature sets end-to-end, cut deployment times from several days to under forty minutes by introducing GitOps with ArgoCD, and unblocked infrastructure issues the project lead had been waiting on engineers to solve for over a year. That pattern, seeing the gap, owning the solution, shipping it without permission, is the one I would bring to PlanD from day one.

At Emil Group I walked into a prototype-stage InsurTech platform where delivery had broken down: a bloated seventeen-person team, eroded client trust, and near-total senior developer attrition. I split the team into smaller Scrum units, reintroduced velocity tracking and structured refinement, rebuilt the weekly communication rhythm with the client, and reduced attrition to a single departure. The domain was InsurTech; the underlying problem was operational software for a complex regulated workflow, which is structurally similar to what ERP for Gebäudereinigung demands: multi-role users, rule-heavy processes, high cost of errors, and users who are not software people.

On the AI-native side, I work daily with Claude, Claude Code, Cursor, Lovable, Framer, and n8n. I use these tools not as productivity accessories but as a core part of how I move from discovery to prototype to specification to shipped feature. I have built my own dev agent framework and a backtesting engine for crypto strategies, which means I understand agentic workflows from the

inside, both as a product designer and as someone who has debugged the failure modes. That hands-on infrastructure orientation is what I would bring to PlanD's AI-first product culture.

I am a native German speaker, Berlin-based, and ready to start in July. I would welcome a conversation about how the current roadmap is structured and where you see the biggest leverage points for a first AI product hire.

Best regards, *Philipp Hilbert*
