Dear Rulemapping team,

I am writing to apply for the Product Manager role on your No-Code/Low-Code platform. The core task described – extracting repeatable solution modules from project delivery and turning them into standards that unblock partners and enable self-service – is work I have done in substance at multiple employers, and it is the kind of problem I find structurally interesting rather than procedurally routine.

At Emil Group, I managed a B2B InsurTech platform whose entire value proposition was shortening insurance product time-to-market from over a year to under a week. That required constant translation between insurer-specific requirements and generalised module boundaries: product configuration, underwriting logic, policy issuance, document management, workflow automation. The Claims Center module I designed and delivered from concept to production is a direct example of the productisation cycle your posting describes – discovery, abstraction, documentation, rollout. I also introduced structured velocity tracking and a refinement process that had broken down under delivery pressure, which maps directly to the KPI discipline you name around wiederverwendungsrate and implementation time reduction.

At the Bundesagentur für Arbeit, I owned a data analytics platform where the recurring challenge was turning ad hoc indicator requests from regional labour offices into standardised, automated ETL pipelines. Introducing Dagster for automated indicator generation was a productisation decision: it replaced one-off data transformations with a reproducible, documented pipeline framework that the team could extend without touching the core logic. That is the same mechanic at work in your rule-engine context.

My technical background is broad enough to hold the abstraction layer credibly. I have worked with REST APIs, Kubernetes-based deployment, low-code platform configuration, and, at Rohde & Schwarz, full GitOps rollout of autonomous feature sets in a regulated defence programme context. I am not a software engineer, but I can read a system design, identify the

integration surface, and write acceptance criteria that engineers trust. That combination – delivery empathy plus technical fluency – is what makes productisation stick rather than become a documentation exercise.

I am a native German speaker and have been working in Berlin-based B2B SaaS environments for most of my career. The GovTech angle is not new territory: I worked on COVID-19 identity management infrastructure at Bundesdruckerei and on FCAS data infrastructure at Rohde & Schwarz, both of which involved multinational stakeholders, compliance constraints, and the kind of precise, auditable documentation your regulated clients will require. I am available on four weeks' notice and genuinely interested in a conversation.

Best regards, *Philipp Hilbert*
