Dear Immowelt Product Team,

I am applying for the Senior Product Manager role owning the agent-facing lead management and mobile tooling. The specific combination in this posting – dual-track discovery, a live migration programme, and a mobile app launch deadline – matches the type of work I have done most recently and find most engaging.

At Emil Group I inherited a prototype-stage InsurTech platform where a 17-person team had lost sprint discipline, clients had lost confidence, and delivery had stalled. I restructured the team into smaller Scrum units, reintroduced velocity tracking and structured refinement, and ran weekly product workshops to rebuild client trust. Within months the team was shipping consistently and senior developer attrition had dropped to a single departure. The parallel to Immowelt's situation is direct: you have a working product in the agents' hands today, a modern replacement being built in parallel, and a migration that requires both careful sequencing and credible communication to the people whose workflow it disrupts.

At Rohde & Schwarz, working on the FCAS defence data platform, I owned features end-to-end including user stories, acceptance criteria, implementation support, and GitOps-based rollout. I unblocked an infrastructure-level issue in OpenShift that engineers had been unable to resolve for over a year and delivered it in one week. I mention this not to signal heroics but to illustrate that my definition of product ownership includes going deep enough into the technical layer to find what is actually blocking delivery. In agent messaging and call tracking, the same principle applies: understanding API latency, webhook reliability, and mobile notification behaviour well enough to have credible architecture conversations with engineers is what separates roadmap management from genuine product ownership.

At the Federal Employment Agency I owned the Arbeitsmarktmonitor analytics platform including its migration to Kubernetes, CI/CD standardisation, and deputy IT security responsibilities. The stakeholder landscape there – federal government, regional

administrations, data science teams, and external auditors – required the same structured communication rhythm that the Immowelt posting describes: aligning engineering, account managers, and senior leadership on a single coherent picture. I introduced Dagster for automated ETL and drove feature delivery that included redesigned dashboards and community tooling, always instrumented for measurability from the start.

On the mobile side, I shipped iOS and Android features at CLINET Platforms for a hospital-facing healthcare app – core flows for chat, document storage, meal and therapy plans – under tight deadlines with a small team and legacy API constraints. Mobile is not a specialisation for me, but it is not unfamiliar territory either.

I am a native German speaker and understand why that matters for a customer-facing product role. The agents using this platform are German-speaking professionals whose vocabulary, workflow expectations, and tolerance for ambiguity in a product are shaped by that context. Conducting site visits, reading support tickets, and synthesising feedback loops requires more than translation; it requires the cultural register that comes with the language natively.

I would welcome the opportunity to discuss the roadmap in more detail.

Best regards, *Philipp Hilbert*
