

Philipp Hilbert. *Platform PM bridging engineering, stakeholders, and delivery.*

Positioning, ten years of hands-on product ownership in regulated, high-velocity environments, now ready to scale Ampr's lead-management platform.

Dear Freyja, Olli, and Maximilian,

Ampr sits at an interesting intersection: a platform that has found product-market fit and now needs to harden its operations to absorb growth without losing the speed that got it there. That is a specific phase, and it needs a specific kind of PM — someone who can carry real delivery weight, keep ceremonies lean, and make decisions without waiting for perfect information. That description fits my working style closely.

Over the past three years I have worked as the sole or lead PM in three consecutive high-pressure B2B environments. At Rohde & Schwarz I owned an AI data platform inside the European FCAS defence programme: multinational stakeholders, hard auditability requirements, and a codebase where infrastructure blockers had been stalling delivery for months. I resolved one critical OpenShift issue independently and delivered the feature the project lead had been requesting from engineers for over a year — in one week. At the Federal Employment Agency I introduced Dagster-based ETL automation, migrated the platform to Kubernetes, and served as Deputy IT Security Officer, all while continuing to advance the product roadmap. At Emil Group I walked into a broken delivery situation — a 17-person team with no sprint discipline, a prototype environment, and clients who had lost trust — and rebuilt velocity by splitting the team, reintroducing ownership concepts, and running structured weekly product workshops until stability returned.

In each case the pattern was the same: read the system fast, find the highest-leverage point, act before having complete information, and communicate clearly enough that stakeholders stay on side while the work happens. I understand technical dependencies and can have a real conversation with engineers about API design, data flow trade-offs, or deployment strategy — not just relay requirements in both directions. That fluency matters at a platform level where the right ticket definition is half the delivery.

On the AI-native side: I use LLM tooling as a daily working environment, not as an experiment. Claude and GPT are part of my spec-writing, edge-case generation, and stakeholder communication preparation. GitHub Copilot and Cursor are part of my in-sprint support loop. This accelerates refinement prep and reduces the back-and-forth between PM and engineering on ambiguous acceptance criteria – something that compounds positively in a small, fast team.

I am based in Berlin, hold full EU work authorisation, and can start with four weeks' notice. I am happy to provide the reference contact you request and look forward to talking with you about the role.

Best regards, *Philipp Hilbert*
