Dear Janis, dear Philipp,

Sales data quality is a workflow problem before it is a technology problem. Reps skip fields not out of laziness but because the entry moment is always wrong – mid-call, post-meeting, end of a long Friday. Weflow's bet is that AI capture removes the entry moment entirely, and that is a product bet I find genuinely compelling. The question of where AI adds real value versus noise is one I have had to answer in high-stakes environments before, and I would like to bring that judgment to your team.

At Rohde & Schwarz, I owned a data management platform for the FCAS programme where the core challenge was identical in structure: multimodal data arriving from many sources, quality that varied by contributor discipline, and downstream ML training that failed silently when inputs were bad. I built filtering, tagging, and audit-trail pipelines that made data provenance visible and actionable, and delivered those features end-to-end – from user stories through GitOps rollout – in an environment where stakeholders were multinational, requirements were incomplete, and timelines were not flexible. That experience gave me a precise feel for the difference between AI features that genuinely reduce cognitive load and AI features that produce confident-looking noise.

At Emil Group, I stepped into a prototype-stage InsurTech platform where sprint discipline had collapsed under delivery pressure. A 17-person team was moving in circles. I split it into focused Scrum units, reintroduced velocity tracking and structured refinement, and ran weekly product workshops to rebuild client trust. Within a quarter the team was shipping again and senior developer attrition had dropped from near-total to one departure. I mention this because Weflow is at the scaling stage where team structure and delivery rhythm start to matter as much as product direction, and I know what it takes to hold both.

At the Federal Employment Agency I led a public analytics platform – Arbeitsmarktmonitor – where the users were regional economists and policy analysts who knew their domain far better than any product team could. I learned to interview for workflows rather than features, to

distinguish what users ask for from what they actually need, and to make prioritisation decisions that held up under scrutiny from stakeholders who would challenge them. That discipline translates directly to the RevOps and sales rep conversations Weflow needs someone to have.

I am based in Berlin, available within four weeks, and genuinely interested in what you are building. I would welcome a direct conversation about the product area you have in mind and the biggest open questions on the roadmap.

Best regards, *Philipp Hilbert*
