Dear Zertificon team,

I am applying for the Product Owner role on your Business Management Platform. The combination of a profitable, owner-led security company, an explicitly internal operations tool with real subscription and licensing complexity, and a team that distinguishes virtual product logic from classical ERP tells me this is a role where the work is genuinely precise – and where imprecision has a visible cost.

My most directly relevant experience is at Rohde & Schwarz, where I owned a central AI data management platform for the FCAS defence programme. That platform was the operational interface between data scientists, ML engineers, backend teams, QA, and multinational stakeholders. My job was to hold the state model – how datasets moved from raw ingestion through transformation, tagging, and audit trail – and translate it into reliable delivery. I wrote the stories, owned the acceptance criteria, unblocked infrastructure issues independently (including a feature the project lead had been requesting for over a year, which I delivered in a week), and managed the GitOps rollout. At Emil Group I rebuilt delivery discipline for a B2B InsurTech platform from near-collapse: split a 17-person team into scrum units with clear ownership, reintroduced velocity tracking, and ran weekly client workshops to rebuild trust in a prototype-stage environment – all while continuing to ship Claims Center from concept to production.

What the Zertificon posting describes – backlog ownership, requirements translation from business and ops teams, technical documentation of data models and state transitions, monitoring and alerting, close collaboration with a second PO on a related portal – maps directly to how I have worked across those roles. I am comfortable with Jira and Confluence as daily tooling. I can read and reason about APIs, webhooks, and middleware without being the one implementing them. I produce mockups in Figma or equivalent when a story needs a visual anchor, not as an aesthetic exercise.

On the subscription and licensing specificity: my background at Qcrypt AG, where I co-founded and owned a security software product built entirely on virtual entitlements and device-bound key states, and at Emil Group, where the entire platform value was in configuration-driven insurance product logic with no physical fulfilment, means I think naturally in terms of states, transitions, and edge cases rather than warehouse quantities. That mental model transfers directly to what you are building.

One thing I noticed in your posting: you mention that if a candidate finds Edward Snowden acted correctly as a whistleblower, you may share the same values – and you donate to a supporting organisation after a passed probationary period. I do share that view. Snowden's disclosures shifted a generation's understanding of surveillance infrastructure, and I think the decision to make them took both moral clarity and significant personal cost. The fact that a security company in Berlin would encode that conviction into its hiring process tells me more about the culture than any benefits list.

Best regards, *Philipp Hilbert*
