Dear Baobab team,

I came across the Product Manager role at Baobab Risk Solutions and read the description carefully. What stood out was not the list of tools or the seniority level but the framing of the work itself: defining the logic is the product. That is exactly how I have approached PM work for the past decade, and it is a harder philosophy to find in job descriptions than it should be.

My most directly relevant experience is at Emil Group, where I joined a B2B InsurTech platform mid-delivery. The product covered the full insurance lifecycle – product configuration, pricing, underwriting, policy issuance, document management, and workflow automation. I delivered a Claims Center module from concept to production, re-established sprint discipline after the team had lost it under delivery pressure, and rebuilt client trust through structured weekly workshops. The platform served primary insurers, reinsurers, MGAs, and brokers, which means I have worked directly with the operational complexity that Baobab is trying to systematise. I know what it means to own underwriting rule configuration, document template logic, and permission structures inside a policy administration platform, and I know how quickly that work stalls if the PM cannot hold the business logic clearly without engineering scaffolding.

On the technical side, I have always worked close to the implementation layer. At Rohde & Schwarz I independently unblocked an OpenShift infrastructure issue and delivered a feature in one week that the project lead had been requesting from engineers for over a year. At the Federal Employment Agency I served as Deputy IT Security Officer, standardised CI/CD pipelines, and migrated legacy systems to Kubernetes while shipping new analytics features in parallel. I am comfortable querying databases, reading and debugging API payloads, and specifying integrations in enough detail that engineers can start without a back-and-forth. That is not a claim about being a developer; it is a claim about not needing a translator for every technical conversation.

The AI-native workflow piece is genuine. I use Claude, GPT, and GitHub Copilot daily for requirements drafting, acceptance criteria generation, and edge-case identification. I have built a

personal multi-agent framework using n8n and file-queue-based agent loops, and I have used Lovable and Framer for rapid prototyping that I can put in front of stakeholders within hours of a discovery conversation. I understand how LLMs can be applied to operational workflow automation not as a theoretical matter but as something I build with week to week.

The cyber insurance domain is new to me, and I will name that directly. My InsurTech background is in the platform and operations layer rather than in cyber risk modelling. What I bring is the operational PM execution the role requires: structured discovery, hands-on platform configuration, automation design, and the discipline to close delivery loops with data. I learn domain logic fast when I can work directly with underwriters and operations, which is how I have operated in every regulated environment I have been in.

I would welcome a conversation about where the biggest operational bottlenecks sit right now and whether my background is the right fit for working through them.

Best regards, *Philipp Hilbert*
