

Philipp Hilbert. *Scrum Product Owner with deep engineering context.*

Positioning, hands-on PM with nearly ten years of backlog ownership, microservice environments, and cross-functional delivery who brings real development experience to stakeholder and sprint work.

Dear PŸUR team,

Scrum Product Ownership at PŸUR sits at the intersection of business requirements, microservice architecture, and multi-team coordination. That specific combination is where I have spent most of the last four years: at Rohde & Schwarz on a distributed data platform with Kubernetes, Argo Workflows, and multinational stakeholders; at the Bundesagentur für Arbeit managing an analytics platform with ETL, CI/CD, and a deputy IT security officer role; and at Emil Group rebuilding sprint discipline and backlog ownership for a B2B SaaS platform in a 17-person team that had lost delivery rhythm. In each case, the core challenge was the same: translate incomplete business requirements into structured, dev-ready stories inside a system that was moving in production.

The requirement for genuine microservice architecture knowledge is one I take seriously. At Rohde & Schwarz I owned features end-to-end through Kubernetes-based GitOps rollout using ArgoCD and Argo Workflows, reduced deployment times from multiple days to under an hour, and independently resolved infrastructure-level OpenShift blockers that had stalled the project. At the Bundesagentur I managed a migration to Kubernetes and standardised CI/CD with full test integration. I do not just understand the architecture layer as a Product Owner talking to engineers – I have navigated it hands-on, which changes the quality and precision of requirements I can produce.

On the multi-team coordination side, the Emil Group engagement is the most relevant example. I inherited a fragmented 17-person team, split it into smaller Scrum units with clear ownership, reintroduced velocity tracking and structured refinement, and rebuilt client trust through weekly product workshops. The company's roadmap commitments had been invisible to management; I made delivery progress visible through KPIs and structured communication – exactly the mechanic your job description calls out. Reducing senior developer attrition from

near-total to a single departure was the outcome I am most proud of, because it reflected a restored working environment rather than a one-time delivery win.

My technical background – original degree in Wirtschaftsingenieurwesen at TU Berlin, years of hands-on Python and Kotlin work, and current AI-native tooling – means I can evaluate feasibility claims from engineering teams with genuine understanding, write acceptance criteria that hold up in review, and communicate timing implications to management with credibility on both sides of the conversation. Jira and Confluence are the tools I live in daily; backlog hygiene and epic structure are not process overhead for me but the primary product artefact.

I am based in Berlin, available within four weeks, and looking forward to a conversation about the specific software components this role owns and the current shape of the product team structure.

Best regards, *Philipp Hilbert*
