Dear Anna Bernardi and the DACHSER Digital Product Group Finance team,

DACHSER is building CUBI – a purpose-built invoicing and purchasing system – inside one of Europe's largest privately held logistics companies. That is a meaningful product problem: financial operations at DACHSER's scale involve complex billing logic, multi-party approval flows, and strict auditability requirements, and the Product Owner role is the person who keeps all of that tractable for an engineering team. I want to do that work.

My clearest parallel is the Emil Group engagement, where I joined a B2B InsurTech platform mid-delivery. The product domain was similarly rule-heavy: insurance product configuration, underwriting logic, claims handling, policy issuance, and document management – each with its own approval logic and regulatory constraints. I rebuilt sprint discipline by splitting a 17-person team into coherent Scrum units, reintroduced velocity tracking, and delivered the Claims Center module from concept to production rollout. The deeper challenge there was not the software; it was restoring enough stakeholder trust that the business would engage honestly with prioritisation decisions. I did that through structured weekly product workshops and transparent communication of technical complexity – the same muscles the CUBI role will require.

At Rohde & Schwarz, I operated as the effective Product Manager inside a defence programme where requirements arrived incomplete and infrastructure blockers were the norm. I delivered autonomous feature sets end-to-end: writing user stories, supporting implementation, running testing, and managing GitOps rollout. I also unblocked a platform-level OpenShift issue independently that engineers had deprioritised for over a year, delivering it in a week. That degree of technical engagement is how I protect sprint commitments rather than escalating blockers upward.

At the Bundesagentur für Arbeit, I was responsible for data transformation, lineage, and auditability on a public analytics platform – the same categories of concern that a billing system raises around transaction traceability and financial audit trails. I introduced Dagster for

automated ETL, standardised CI/CD, and served as Deputy IT Security Officer with focus on data governance. Structured, rule-bound data with compliance implications is familiar territory.

My academic background in Wirtschaftsingenieurwesen at TU Berlin, with a logistics specialisation, means I understand the operational context DACHSER works in – not just as a service provider but as a network with its own cost structure and allocation logic. That context matters when translating stakeholder requests from the finance department into stories that the development team can actually build.

I am based in Berlin and open to relocating to Munich. I look forward to the conversation.

Best regards, *Philipp Hilbert*
