

Philipp Hilbert. *Product Owner for digital platforms that move real-world markets.*

Positioning, nearly ten years turning complex operational workflows into scalable digital products, now applied to sustainable mobility at Bikeleasing.

Dear Bikeleasing team,

Your platform sits at a point most B2B SaaS companies only aspire to: genuine scale, a clear social mission, and a product that still has significant room to grow in terms of user experience and technical sophistication. The job description mentions explicitly that you expect a Product Owner who uses AI tools not as a marketing point but as a practical accelerant across the entire product lifecycle – from requirement analysis to backlog refinement to release planning. That specificity caught my attention, because it matches how I have actually worked for the past several years.

At Rohde & Schwarz, where I owned the AI data management platform for the FCAS defence programme, I delivered features end-to-end – user stories, acceptance criteria, implementation support, testing, and GitOps-based rollout – in a high-stakes, multinational environment where requirements were often incomplete and stakeholders spoke different technical languages. I used LLM-assisted workflows daily to accelerate specification quality and edge-case coverage. The result was measurable: deployment times dropped from several days to 20–40 minutes after I introduced GitOps with ArgoCD, and I unblocked infrastructure-level issues that engineers had deprioritised for over a year, delivering a critical feature in one week as sole developer.

At Emil Group, I inherited an InsurTech platform where a 17-person team had lost sprint discipline under delivery pressure. I split the team into focused Scrum units, reintroduced velocity tracking, and rebuilt client trust through structured weekly workshops. Churn of senior developers dropped from near-total to a single departure. The mechanics there – restoring predictability, sharpening requirement quality, moderating between business and engineering – are directly applicable to a fast-growing platform like yours, where scale is increasing the cost of imprecision.

My technical background – Python, REST APIs, Kubernetes, CI/CD, database fundamentals – means I can assess feasibility independently without becoming a bottleneck for engineering. I

understand when a proposed feature is architecturally straightforward and when it carries hidden complexity. That fluency is what allows me to write user stories that engineers actually trust, rather than stories that need a separate translation step in every refinement session.

Bikeleasing is building infrastructure for a mobility shift that is still in its early innings in Germany. I would like to contribute to making that platform faster, cleaner, and more useful for the employers and employees who rely on it. I am available within four weeks of an offer and open to discussing the role in detail.

Best regards, *Philipp Hilbert*
