Dear Hiring Team at Materna Virtual Solution,

Product ownership in the government security space demands a specific combination: enough technical depth to challenge engineering estimates, enough regulatory literacy to represent compliance requirements accurately to development teams, and enough communication discipline to keep administrators, security officers, and product management aligned without creating an information bottleneck. My decade of product ownership across defence, public sector analytics, and regulated healthcare has been built around exactly that combination.

At Rohde & Schwarz, I owned the product for a central AI and data management platform within the European defence programme FCAS. That context required me to translate multinational stakeholder requirements – many of them classified or operationally sensitive – into developer-ready user stories while maintaining audit trails, data provenance, and SafeAI transparency concepts that would survive external review. I delivered feature sets autonomously from user story through acceptance criteria through GitOps-based rollout, reducing deployment cycles from several days to under forty minutes. The regulatory and operational pressure in that environment is the closest parallel I can offer to the Apple indigo context.

At the Bundesagentur für Arbeit, I served as Deputy IT Security Officer while simultaneously owning the Arbeitsmarktmonitor product. The dual role forced a habit I have carried since: treating security requirements not as constraints imposed after the fact but as inputs to the initial prioritisation. That is the mindset the VS-NfD and KRITIS context demands, and it is already how I run refinement.

Earlier, as co-founder and Product Owner at Qcrypt AG, I was responsible for a quantum-secure encryption product targeting public administration users. The product had to be cryptographically rigorous and operationally trivial – under two minutes to set up, no technical

knowledge required. That tension between security depth and usability simplicity is precisely what the Apple indigo platform navigates: enterprise-grade mobile security that field personnel can actually use. I also served as deputy IT security officer at Qcrypt, which gave me early exposure to the governance and approval processes that products in this space must satisfy.

The role you have described – owning roadmap, backlog, stakeholder coordination, and release planning for the Trust product family – maps cleanly onto the scope I have held for the past several years. I am comfortable facilitating refinement with engineers in the morning and presenting a product strategy to public-sector decision-makers in the afternoon. I am fluent in Scrum, direct in written and spoken German and English, and comfortable with the kind of iterative, compliance-constrained delivery that Apple indigo requires. I would welcome a conversation about how my background fits the specifics of the role.

Best regards, *Philipp Hilbert*
