Dear Mobexo team,

Fleet management digitisation is a domain where the gap between what customers need and what legacy systems deliver is still wide. The Mobexo stack – Azure OpenAI alongside Dynamics CRM, React Native mobile apps, and SAP integration – tells me the team is building serious software to close that gap, not just wrapping spreadsheets in a web interface. That is the kind of product challenge I am drawn to.

My most recent role at Rohde & Schwarz was a government contract inside the FCAS defence programme, where I owned a central AI and data management platform for multimodal datasets. Working with multinational stakeholders in a high-stakes, regulated environment required exactly the balance the Mobexo posting describes: rational feature prioritisation, clear communication of the Mobexo vision equivalent, and the ability to move a cross-functional team – architect, data scientists, backend and frontend engineers, QA – without losing delivery momentum. I reduced deployment times from several days to 20–40 minutes by introducing GitOps, and I independently unblocked an OpenShift infrastructure issue that had been on the engineer backlog for over a year, delivering it in one week.

At Emil Group, an InsurTech B2B SaaS platform, I took over a sprint process that had effectively collapsed. A bloated 17-person team was missing velocity entirely. I split it into smaller Scrum units, reintroduced structured refinement, and recovered client trust through weekly product workshops and transparent communication. That experience maps directly to what the Mobexo posting asks for: stakeholder management with key customers, intuitive prioritisation of competing needs, and keeping a distributed, international dev team aligned on a shared vision.

Earlier, at the Proxy Product Owner role for AOK ITSCare, I led the migration of an internal webshop to Shopware, including complex catalogue and API integration with customisable approval policies – a project that required translating non-technical procurement requirements into dev-ready specifications under tight constraints. And at Qcrypt AG as Product Owner, I

owned a quantum-secure encryption product end-to-end, including serving as deputy IT security officer, which gave me early experience bridging product, engineering, and security concerns in a regulated context.

Mobexo sits at an interesting moment: a fleet digitisation platform backed by a 150-year-old family company's infrastructure, moving fast on Azure and mobile. I am ready to own the roadmap, align the stakeholders, and ship working software in 3-week cycles. I would welcome a conversation.

Best regards, *Philipp Hilbert*
