Dear Boardwise team,

Governance tooling sits at a specific product intersection: the workflows are high-stakes, the stakeholders are senior, the tolerance for ambiguity in requirements is low, and the pressure to show AI-driven value is high without sacrificing the auditability that boardrooms require. That combination is exactly the type of product problem I have spent the last several years working on in different forms.

At Rohde & Schwarz I owned an AI data management platform for the European FCAS defence programme, where data provenance, transparency, and reproducibility were contractual requirements, not optional features. I translated multinational stakeholder requirements into dev-ready user stories, delivered autonomous feature sets end-to-end through GitOps rollout, and led a cross-functional team of architects, data scientists, and frontend and backend engineers. The AI and auditability challenges there are structurally similar to what Boardwise faces: embedding intelligence into a high-trust environment where the outputs must be explainable.

At the Federal Employment Agency I owned backlog and delivery for a public-sector analytics platform, served as Deputy IT Security Officer, and managed a full migration to Kubernetes. That role required the same senior-stakeholder management discipline your posting names – presenting to ministry-level contacts, aligning compliance and data-governance requirements with engineering capacity, and keeping delivery moving despite shifting political priorities. At Emil Group I rebuilt delivery stability for a 17-person InsurTech team in a prototype-stage environment under significant client pressure, which required precisely the structured backlog ownership and transparent stakeholder communication your posting asks for.

On the Microsoft-ecosystem requirement: I have hands-on experience with Office 365 and M365 tooling from client delivery work, and my current AI-native workflow – which includes using LLMs for spec generation, edge-case analysis, and acceptance-criteria review alongside GitHub Copilot for in-repo work – translates directly into the Copilot and LLM-feature integration work you are driving. I also bring a working understanding of Azure-hosted infrastructure from adjacent project contexts.

I am based in Berlin, hold German as my native language and English at C2, and am available with four weeks' notice. I would welcome a conversation about how the product ownership role fits into Boardwise's current roadmap phase.

Best regards, *Philipp Hilbert*
