

Philipp Hilbert. *Technical Product Manager building in AI-native environments.*

Positioning, Senior PM and hands-on builder who turns business requirements into production software using Claude Code daily, without ceremony.

Dear Faisal and the Noorex.io team,

I am applying for the Technical Project Manager / Technical Product Manager role at Noorex.io. The posting describes something I have not seen stated this plainly before: a business that is genuinely AI-native, operating inside a regulated industry, where ideas can reach production the same day they are discussed. That is not a stretch goal for me, it is how I have been working for the past two years.

The non-negotiable you named is Claude Code or Codex every day. I use Claude Code daily: to write specifications, to prototype features, to run in-repo refactors, and to build production-grade tooling when the engineering team is occupied elsewhere. When I founded construct8, a two-sided B2B staffing marketplace, I built the entire product alone, matching engine, qualification flows, LLM agents across the funnel, with Claude Code as the primary instrument. That is the Product Builder profile you described in Role 2. At the same time, I have spent thirteen years writing the kind of precise, unambiguous technical specifications that senior engineers actually want to work from, coordinating cross-functional teams in regulated contexts, defence AI at Rohde & Schwarz, national analytics infrastructure at the Federal Employment Agency, healthcare and insurance platforms. That is the Technical Project Manager profile in Role 1.

In regulated environments, the challenge is always the same: moving fast without cutting corners that create compliance or audit exposure. At the Bundesagentur für Arbeit I carried a full bare-metal-to-containers migration, a UI relaunch and a large ETL migration simultaneously, while serving as Deputy IT Security Officer and keeping the data platform within its regulatory envelope. At Rohde & Schwarz I reduced rollout time from days to 30 minutes for a multinational AI and data platform by championing GitOps delivery, not by simplifying the regulatory requirements, but by engineering the delivery pipeline so compliance was built in rather than bolted on.

The self-organisation requirement is one I take seriously. I do not need a process around me to stay oriented. I maintain my own dependency maps, flag blockers before they become delays, and default to producing a working artefact rather than a slide about one. If the answer to a business problem can be prototyped in Claude Code in two hours, I will have a prototype ready before the next conversation rather than a requirements document asking for engineering time.

I am available immediately and happy to show rather than tell in a short scoping call.

Best regards, *Philipp Hilbert*
