Dear Bjak team,

I am applying for the Technical Product Manager, AI Finance role. My background spans 13 years of product ownership in regulated environments, payments, insurance, defence AI, public-sector data, and I have spent the last several years building the technical fluency to work as a genuine peer to engineering rather than a requester of features.

The part of your job description that resonated most directly was the explicit call to own a vertical end-to-end, from strategy through technical design, delivery, and launch, including the regulatory and third-party rails that actually gate launch. That is the work I know best. At EMIL Group I took the Claims Center from concept to production on an insurance platform serving reinsurers, brokers, and underwriters, a domain with the same combination of financial correctness requirements, compliance constraints, and multi-party API dependencies that characterises Bjak's stack. At Rohde & Schwarz I owned the internal AI and data platform for the FCAS European programme, managing cross-functional delivery across 15-plus engineers and data scientists while holding the line on audit trails, pipeline reliability, and hotfix capability. In both cases the job was not managing a backlog; it was holding the whole system in view, architecture, failure modes, regulatory gates, and user outcomes, simultaneously.

Your statement that AI is a means, not the goal, is one I agree with and one I have applied in practice. At Rohde & Schwarz I instrumented two competing product workflows, a UI-led approach and a developer-code-first approach, and the UI-led one recorded exactly zero clicks in production. The pipeline-runs metric that actually mattered rose 200 percent when we deprioritised the beautiful thing and shipped the useful one. That is the discipline your posting describes: knowing where AI genuinely improves an outcome, where deterministic systems must stay in control, and how to build products that are reliable, auditable, and trusted. I have designed evaluation loops and human-in-the-loop safeguards for LLM-powered features, and I understand when the right answer is not to use a model at all.

On the fintech side, I co-founded Kvitt Payment Solutions and took a mobile P2P payments product from zero through acquisition by Sparkasse, operating inside the girocard ecosystem. That meant building payment flows, handling edge cases around transaction state and settlement, and navigating the regulatory environment of a licensed financial rails partner, the same class of constraints your payments and remittance verticals face. I also have direct experience with insurance as a product domain from EMIL Group, which aligns with Bjak's core insurance platform heritage.

Bjak is operating at a scale and in a market complexity, Southeast Asia, multiple currencies, multiple regulatory regimes, real money moving across payments, remittance, insurance, and trading, that I find genuinely compelling. I am ready to move fast, clear the gates that actually block launch, and hold engineering, compliance, and operations aligned around decisions that hold up when challenged.

Best regards, *Philipp Hilbert*
