Dear UMATR Hiring Team,

I am applying for the AI Product Manager role. I have spent the past four years building AI and data products in environments where the output quality is not optional, a national defence AI platform for the FCAS European programme, a public-sector labour-market analytics system used by policymakers, and a series of agentic workflow products built on LLMs and multi-agent orchestration. The common thread across all of them is the problem UMATR's posting names explicitly: making AI outputs accurate, explainable and reliable when the stakes are high.

At Rohde & Schwarz I owned an internal AI and data platform across a multinational engineering team of 15+ people. The work that moved the needle was not the UI, instrumentation of two competing developer workflows showed the beautiful interface recorded exactly zero clicks, while the code-first path drove a 200% increase in pipeline runs. That experience shaped how I think about AI product quality: instrument before you build, agree on what good looks like before you ship, and treat hallucination rates and eval coverage as product metrics alongside retention and throughput.

At the Bundesagentur für Arbeit I introduced Dagster and dbt into a quarterly ETL process for a national analytics platform, cutting the time per data update by roughly 75% and making the pipeline self-auditing. Structured data pipelines, lineage, and the ability to trace a model output back to its source data are not engineering concerns I hand off, they are the foundation of an AI product that a regulator or a credit committee can trust.

UMATR's focus on financial analysis, risk assessment and deal evaluation is the domain where I want to apply this stack. I co-founded Kvitt Payment Solutions, a mobile P2P payment product that was acquired and operated inside the Sparkasse girocard ecosystem, which gave me early-stage fintech product experience at the infrastructure layer. Separately, I have spent years working with crypto market microstructure, execution quality and algorithmic decision frameworks, the kind of structured financial reasoning that translates directly into the data representations and evaluation logic that capital-access products require.

I am based in Berlin and actively targeting the UAE, so the Abu Dhabi location is a positive fit rather than a compromise. I am available at short notice and happy to talk through the product and technical specifics at whatever depth is useful.

Best regards, *Philipp Hilbert*
